Optimal Regulation of Credit Lines

Jose E. Gutierrez

CEMFI

EEA-ESEM 2022

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

Credit lines: An overview

• **Credit line** (CL): A commitment in which a bank promises funding on demand at *predetermined terms* (interest rate + fees)

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

Credit lines: An overview

- **Credit line** (CL): A commitment in which a bank promises funding on demand at *predetermined terms* (interest rate + fees)
- Important item in banks and firms' financial statements us
 - $\rightarrow\,$ CLs represent 42% of Spanish firms' bank financing (Jiménez et al., 2009)

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

Credit lines: An overview

- **Credit line** (CL): A commitment in which a bank promises funding on demand at *predetermined terms* (interest rate + fees)
- Important item in banks and firms' financial statements
 → CLs represent 42% of Spanish firms' bank financing (Jiménez et al., 2009)
- Despite their importance, the literature on CLs is relatively scarce

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

- In crises,
 - \rightarrow Riskier firms may be denied funding (due to violation of financial covenants)
 - $\rightarrow\,$ Financially distressed banks may not be able to extend funding

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

- In crises,
 - \rightarrow Riskier firms may be denied funding (due to violation of financial covenants)
 - $\rightarrow\,$ Financially distressed banks may not be able to extend funding
- · Losing access to liquidity when needed can negatively affect firms

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

- In crises,
 - \rightarrow Riskier firms may be denied funding (due to violation of financial covenants)
 - $\rightarrow\,$ Financially distressed banks may not be able to extend funding
- · Losing access to liquidity when needed can negatively affect firms
 - $\rightarrow~$ Passing up investment opportunities

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

- In crises,
 - \rightarrow Riskier firms may be denied funding (due to violation of financial covenants)
 - $\rightarrow\,$ Financially distressed banks may not be able to extend funding
- · Losing access to liquidity when needed can negatively affect firms
 - $\rightarrow~$ Passing up investment opportunities
 - $\rightarrow~$ In extreme situations, being liquidated

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

- In crises,
 - \rightarrow Riskier firms may be denied funding (due to violation of financial covenants)
 - $\rightarrow\,$ Financially distressed banks may not be able to extend funding
- · Losing access to liquidity when needed can negatively affect firms
 - $\rightarrow~$ Passing up investment opportunities
 - $\rightarrow~$ In extreme situations, being liquidated
- To prevent this, firms may run on their CL Gigure

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

- In crises,
 - \rightarrow Riskier firms may be denied funding (due to violation of financial covenants)
 - $\rightarrow\,$ Financially distressed banks may not be able to extend funding
- · Losing access to liquidity when needed can negatively affect firms
 - $\rightarrow~$ Passing up investment opportunities
 - ightarrow In extreme situations, being liquidated
- To prevent this, firms may run on their CL Gue
 - $\rightarrow\,$ Funds are drawn down even though they are still not needed

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

- \bullet A contract-theoretical model of CLs w/
 - $\rightarrow\,$ Aggregate uncertainty

Introduction 00●0 Model 0000000 Equilibrium Analysis 000 Social welfare analysis

Conclusions 00

- A contract-theoretical model of CLs w/
 - $\rightarrow~{\sf Aggregate}$ uncertainty
 - $\rightarrow\,$ A fire-sale externality in the liquidation value of firms

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

- \bullet A contract-theoretical model of CLs w/
 - $\rightarrow \ \mathsf{Aggregate} \ \mathsf{uncertainty}$
 - $\rightarrow\,$ A fire-sale externality in the liquidation value of firms
- At an ex-ante stage
 - \rightarrow Firms and banks agree on CL contractual terms (interest rates + fees)

Model 0000000 Equilibrium Analysis 000 Social welfare analysis

Conclusions 00

- \bullet A contract-theoretical model of CLs w/
 - $\rightarrow \ \mathsf{Aggregate} \ \mathsf{uncertainty}$
 - $\rightarrow\,$ A fire-sale externality in the liquidation value of firms
- At an ex-ante stage
 - \rightarrow Firms and banks agree on CL contractual terms (interest rates + fees)
 - $\rightarrow\,$ Banks choose pre-funding for cash reserves

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

- \bullet A contract-theoretical model of CLs w/
 - $\rightarrow \ \mathsf{Aggregate} \ \mathsf{uncertainty}$
 - $\rightarrow\,$ A fire-sale externality in the liquidation value of firms
- At an ex-ante stage
 - \rightarrow Firms and banks agree on CL contractual terms (interest rates + fees)
 - $\rightarrow~$ Banks choose pre-funding for cash reserves
- Banks finance drawdowns w/ pre-funding & additional funding (as needs arise)

Model 0000000 Equilibrium Analysis 000 Social welfare analysis

Conclusions 00

- \bullet A contract-theoretical model of CLs w/
 - $\rightarrow \ \mathsf{Aggregate} \ \mathsf{uncertainty}$
 - $\rightarrow\,$ A fire-sale externality in the liquidation value of firms
- At an ex-ante stage
 - \rightarrow Firms and banks agree on CL contractual terms (interest rates + fees)
 - $\rightarrow\,$ Banks choose pre-funding for cash reserves
- Banks finance drawdowns w/ pre-funding & additional funding (as needs arise)
- Additional funding is limited by banks' capacity to repay

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

- \bullet A contract-theoretical model of CLs w/
 - $\rightarrow \ \mathsf{Aggregate} \ \mathsf{uncertainty}$
 - $\rightarrow\,$ A fire-sale externality in the liquidation value of firms
- At an ex-ante stage
 - \rightarrow Firms and banks agree on CL contractual terms (interest rates + fees)
 - $\rightarrow\,$ Banks choose pre-funding for cash reserves
- Banks finance drawdowns w/ pre-funding & additional funding (as needs arise)
- Additional funding is limited by banks' capacity to repay
- In high liquidity need states, low pre-funding can cause liquidations
 - $\rightarrow\,$ Cash-strapped firms w/o funding are liquidated (at fire-sale prices)

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

- A contract-theoretical model of CLs w/
 - $\rightarrow \ \mathsf{Aggregate} \ \mathsf{uncertainty}$
 - $\rightarrow\,$ A fire-sale externality in the liquidation value of firms
- At an ex-ante stage
 - \rightarrow Firms and banks agree on CL contractual terms (interest rates + fees)
 - $\rightarrow\,$ Banks choose pre-funding for cash reserves
- Banks finance drawdowns w/ pre-funding & additional funding (as needs arise)
- Additional funding is limited by banks' capacity to repay
- In high liquidity need states, low pre-funding can cause liquidations
 - $\rightarrow\,$ Cash-strapped firms w/o funding are liquidated (at fire-sale prices)
 - $\rightarrow\,$ Anticipation of high liquidity needs may trigger a run

 $\rightarrow\,$ The bank commits to raise pre-arranged funding per committed funds equal to E and invest it in cash at t=0

Equilibrium Analysis

Social welfare analysis 000 Conclusions 00

Banks

- Representative bank offers CL contract (B, E) with sequential service constraint to the continuum of firms at t = 0
 - $\rightarrow\,$ Access to 1 unit of funds
 - ightarrow Payment scheme $B_s \leq Y$

$$B_s = egin{cases} B_1, & ext{if drawdown happens at } s = 1, \ B_2, & ext{if drawdown happens at } s = 2, \ B_3, & ext{if no drawdown happens} \end{cases}$$

- $\rightarrow\,$ The bank commits to raise pre-arranged funding per committed funds equal to E and invest it in cash at t=0
- \rightarrow Pre-arranged funding *E* is junior to funding raised at t=1,2 (e.g., LT debt or equity)

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

The Allocation Problem

- In high liquidity need states, α may not be met: $D_1 + D_2 < \alpha E$
 - \rightarrow Loan requests are granted sequentially (in random order) until no more funding can be raised by the bank

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

The Allocation Problem

- In high liquidity need states, α may not be met: $D_1 + D_2 < \alpha E$
 - \rightarrow Loan requests are granted sequentially (in random order) until no more funding can be raised by the bank
- If large liquidations are expected, firms in need of cash may draw down (run) at t = 1

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

The Allocation Problem

- In high liquidity need states, α may not be met: $D_1 + D_2 < \alpha E$
 - \rightarrow Loan requests are granted sequentially (in random order) until no more funding can be raised by the bank
- If large liquidations are expected, firms in need of cash may draw down (run) at t=1
- Junior pre-funding E helps to sustain lending over a wider range of α 's
 - $\rightarrow\,$ Claims associated to E can be diluted to raise additional funds at t=1,2
 - \rightarrow Yet, pre-funding *E* demands a higher return

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

Solving for the unregulated CL contract

The representative bank's problem:

• Given aggregate liquidations $z(\alpha)$, the expected payoff of the representative firm is maximized subject to

- 1. Some incentive compatibility constraints that prevent opportunism
- 2. The participation constraint of investors who provide E

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

Solving for the unregulated CL contract

The representative bank's problem:

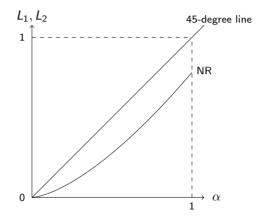

• Given aggregate liquidations $z(\alpha)$, the expected payoff of the representative firm is maximized subject to

- 1. Some incentive compatibility constraints that prevent opportunism
- 2. The participation constraint of investors who provide E
- (+) Symmetric eq. can fully characterize the unregulated CL (B^U, E^U)

Equilibrium Analysis

Social welfare analysis

Conclusions 00

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

Unregulated CL contract

- Trade-off of increasing *E*:
 - $\rightarrow\,$ Wider realizations of $\alpha\,$ can be insured
 - \rightarrow Financing *E* is costlier

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

Unregulated CL contract

- Trade-off of increasing *E*:
 - $\rightarrow\,$ Wider realizations of $\alpha\,$ can be insured
 - \rightarrow Financing *E* is costlier
- If high realizations of α are rare, *E* is optimally chosen s.t. the unregulated CL contract features liquidations & runs

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

Unregulated CL contract

- Trade-off of increasing *E*:
 - $\rightarrow\,$ Wider realizations of $\alpha\,$ can be insured
 - \rightarrow Financing *E* is costlier
- If high realizations of α are rare, E is optimally chosen s.t. the unregulated CL contract features liquidations & runs
- Banks do not internalize the effect of liquidations on eq. liquidation values
 - $\rightarrow~$ Scope for regulation

Model 0000000 Equilibrium Analysis

Social welfare analysis •00 Conclusions 00

Solving for the constrained efficient CL contract

The social planner's problem:

- The expected payoff of the representative firm is maximized subject to
 - 1. Some incentive compatibility constraints that prevent opportunism
 - 2. The participation constraint of investors who provide E
 - 3. Aggregate liquidations

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

Constrained efficient CL contract

- Trade-off of increasing *E*:
 - $\rightarrow\,$ Wider realizations of α can be insured + excessive liquidations can be avoided
 - \rightarrow Financing *E* is costlier

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

Constrained efficient CL contract

- Trade-off of increasing *E*:
 - $\rightarrow\,$ Wider realizations of α can be insured + excessive liquidations can be avoided
 - \rightarrow Financing *E* is costlier
- Socially desirable to increase $E > E^U$

Model 0000000 Equilibrium Analysis 000 Social welfare analysis 00● Conclusions 00

Implementation

• By means of a regulation that requires banks to pre-finance CL drawdowns with a minimum \underline{E} of pre-arranged junior funding (e.g., Basel III liquidity ratios)

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

Implementation

• By means of a regulation that requires banks to pre-finance CL drawdowns with a minimum \underline{E} of pre-arranged junior funding (e.g., Basel III liquidity ratios)

Result

If $\underline{E} = E^*$, then the regulated eq. is constrained efficient.

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

Implementation

• By means of a regulation that requires banks to pre-finance CL drawdowns with a minimum \underline{E} of pre-arranged junior funding (e.g., Basel III liquidity ratios)

Result

- If $\underline{E} = E^*$, then the regulated eq. is constrained efficient.
- Effects of regulation:
 - $\rightarrow~{\rm CLs}$ become more expensive

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

Implementation

• By means of a regulation that requires banks to pre-finance CL drawdowns with a minimum \underline{E} of pre-arranged junior funding (e.g., Basel III liquidity ratios)

Result

If $\underline{E} = E^*$, then the regulated eq. is constrained efficient.

• Effects of regulation:

- $\rightarrow~\text{CLs}$ become more expensive
- $\rightarrow\,$ Fewer costly liquidations in 'bad times'

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

Implementation

• By means of a regulation that requires banks to pre-finance CL drawdowns with a minimum \underline{E} of pre-arranged junior funding (e.g., Basel III liquidity ratios)

Result

If $\underline{E} = E^*$, then the regulated eq. is constrained efficient.

- Effects of regulation:
 - $\rightarrow~$ CLs become more expensive
 - $\rightarrow\,$ Fewer costly liquidations in 'bad times'
 - $\rightarrow\,$ A higher liquidation value is obtained if a liquidity need is not covered

Model 0000000 Equilibrium Analysis

Social welfare analysis

Conclusions 00

Implementation

• By means of a regulation that requires banks to pre-finance CL drawdowns with a minimum \underline{E} of pre-arranged junior funding (e.g., Basel III liquidity ratios)

Result

If $\underline{E} = E^*$, then the regulated eq. is constrained efficient.

- Effects of regulation:
 - $\rightarrow~$ CLs become more expensive
 - $\rightarrow\,$ Fewer costly liquidations in 'bad times'
 - $\rightarrow\,$ A higher liquidation value is obtained if a liquidity need is not covered
 - $\rightarrow\,$ A reduction in the occurrences of CL runs

Model 0000000 Equilibrium Analysis
