This project receives funding from the European Union's Horizon 2020 Resesarch and Innovation Programme under Grant Agreement No 101004703.

Motivation 1/2

- ▶ **Individuals' skills** are important for their success on the labor market (e.g., Hanushek et al., 2015)
- ▶ However, **lack of suitable skill data**, in particular, on early-career skills
- ▶ **Worker skills** are important to understand future
 - occupational choices
 - career patterns
 - susceptibility to technological change

Motivation 2/2

Motivation: Lack of suitable data on workers' skills relevant on the labor market

- ▶ **School attainment measures or skill assessment tests** are only a crude approximation for an individual's actual range of labor-market-relevant skills
- ▶ Potential **drawbacks** with skill assessment data:
 - often reflect subject-specific ability rather than skills required on the job
 - cover only a limited range of an individual's skill set
 - rely on a small number of specialized data sets
- ▶ Task surveys (e.g., O*NET, BERUFENET) just provide **occupation-level averages**

This Paper

Skill Data:

- ▶ We use text data from **standardized apprenticeship plans** to construct **relevant, comprehensive, and detailed** measures of worker skills in Germany
- ▶ Unique German setting:
 - **Same skills** are taught in an apprenticeship throughout Germany
 - Apprenticeship plans also specify the **exact duration** apprentices learn a specific skill

Empirical Approach:

- ▶ We link occupational skill intensities to **administrative labor-market records** to investigate **returns to skills over workers' careers**
- ▶ We control for a rich set of **worker** and (apprenticeship) **establishment** characteristics, including apprenticeship fields
- ▶ We leverage **complementary survey data** and **establishment information** to control even more rigorously for **selection** into apprenticeships

Preview of Results: Apprenticeship skills matter!

Institutional Setting

- ▶ German apprenticeship system
 - About **60% of workers in Germany** have completed an apprenticeship
 - Apprenticeship training is targeted at graduates from **lower or intermediate secondary schools**, typically start apprenticeship directly after school
 - Dual system: apprenticeships combine **on-the-job training** in firms and **education** at public vocational schools
- ▶ Unique institutional setting for deriving skill measures
 - Requirements of apprenticeship training are codified in **state-approved apprenticeship plans**
 - Plans are **standardized** across Germany by the *Vocational Training Act*
 - **Uniform examination formalities** ensure that apprentices gain the skills stated in the respective apprenticeship plan
- ▶ This setting allows to identify the **actual early-career skills** of a large part of the labor force

Data Overview: Apprenticeship Plans

- ▶ Contain the **skills apprentices are required to learn** within their apprenticeship
- ▶ Our data cover skills from the 165 largest apprenticeship occupations (**>85% of the German workforce with an apprenticeship**)
- ▶ Each plan:
 - Corresponds to one occupation
 - States the occupational skill content with a **detailed depiction of skills** provided at all stages of the apprenticeship (Ø 120 skills)
 - Provides the **exact number of weeks** a specific skill has to be learnt
- ▶ In total, we have classified \approx **13,000 skills**

Example: Apprenticeship Plan

Apprenticeship plan for vocational training to become an e-commerce merchant

Section A: Skills, knowledge, and abilities for this professional profile

Seq. Nr	Part of the apprenticeship profile	Skills, knowledge, and abilities to be taught	Temporal references in weeks in	
			Month 1 to 15	Month 16 to 36
1	2	3	4	
1	Selection and usage of online sales channels (§ 4 paragraph 2 number 1)	<ul style="list-style-type: none"> a) Select and differentiate online sales channels according to scope of services, performance, areas of application, and economic efficiency b) Evaluate user behavior and derive suggestions for improvement for online sales c) Analyze process flows and further develop concept for user-friendly interface d) Adhere to legal regulations and operational requirements, in particular regarding information obligations, competition law, trademark protection, copyright and data protection, when using the online sales channel e) Assess the technical and organizational requirements and framework conditions for the use of new online sales channels in connection with different business models and derive measures f) Cooperate with internal and external service providers in the further development and optimization of online sales systems, define scope of services and control service delivery 		16

Skill Classification (following Deming and Kahn, 2018)

Occupational Skills	Keywords and Phrases
Cognitive	Math and statistics, critical/analytical thinking, problem solving and decision making, language, creativity, innovation, economics, accounting, business analysis, evaluation
Social	Teamwork, communication, negotiation, presentation, consultation and advice, customer service, service orientation, time management, adaptability, flexibility, stress tolerance
Digital	Basic computer skills, office software, data analysis, data security, software
Manual	Construction, transportation, general physical activities, maintenance, installation, repairing, tools
Management Administrative	Management of personnel and financial resources, project management Writing, scheduling, support activities, law and regulations

Apprenticeship examples:

- ▶ **Cognitive:** Physical Laboratory Technician, Tax Assistant, Technical Product Designer
- ▶ **Social:** Bank Clerk, Hotel Industry Clerk, Hairdresser
- ▶ **Digital:** Geomatics Engineer, IT Management Assistant

- ▶ Skill correlations Correlations
- ▶ Strong correlation with existing **occupation-level task measures** for Germany (Dengler and Matthes, 2018) DM
- ▶ Strong correlation with **PIAAC test scores** PIAAC scores and **PIAAC task use** PIAAC tasks
- ▶ Strong correlation between **skills over the career** Transferability over the life cycle

Administrative Labor-Market Data

- ▶ **Sample of Integrated Labour Market Biographies (SIAB)**
 - Administrative data covering a **2% sample** of the German workforce
 - Time coverage of our analysis: **1990–2017**
 - Provides workers' **full employment histories** (including apprenticeship occupation)
 - Contains information on **earnings**, basic **demographic** characteristics, and **establishment** characteristics
 - Our sample consists of **full-time workers** whom we can follow **more than 15 yrs** after labor-market entry
- ▶ We link skill data to labor-market data at the **level of apprenticeship occupations** (five-digit)

Empirical Specification

$$Y_{ijrty} = \alpha + \mathbf{Skills}_j' \beta_1 + \mathbf{Worker}_{iy}' \beta_2 + \mathbf{Apprenticeship}_{jrt}' \beta_3 + \varepsilon_{ijrty}$$

Y_{ijrty} :	Outcome (e.g., log daily wage) of individual i who completed an apprenticeship in occupation j , region r , and year t in period $y \in \{1-5, 6-10, 11-15, 16-20\}$
S_j :	Skills developed through an apprenticeship in occupation j
\mathbf{Worker}_{iy} :	Vector of basic worker characteristics (nationality, age fixed effects, and pre-apprenticeship education)
$\mathbf{Apprenticeship}_{jrt}$:	FE for district of training company, apprenticeship occupation (1-digit), and year of apprenticeship completion
ε_{ijrty} :	Error term

Apprenticeship Skills and Wage Levels

	Log daily wages after			
	1–5 yrs (1)	6–10 yrs (2)	11–15 yrs (3)	16–20 yrs (4)
Cognitive skills (months)	0.008 (0.0050)	0.010** (0.0045)	0.011** (0.0044)	0.013*** (0.0042)
Social skills (months)	0.007 (0.0055)	0.013** (0.0053)	0.016*** (0.0051)	0.015*** (0.0049)
Digital skills (months)	-0.004 (0.0056)	0.010 (0.0065)	0.017** (0.0077)	0.021*** (0.0080)
All skills	Yes	Yes	Yes	Yes
Worker characteristics	Yes	Yes	Yes	Yes
<i>Apprenticeship controls</i>				
Completion year FE	Yes	Yes	Yes	Yes
County of establishment FE	Yes	Yes	Yes	Yes
Occupation FE (1-digit)	Yes	Yes	Yes	Yes
F-statistic (all skills)	1.7	4.9	7.0	8.1
N (individuals)	66,432	66,432	66,432	66,432

Notes: Sample consists of workers with a completed apprenticeship training whom we can follow in the first four consecutive 5-year periods after labor market entry. To be included in the sample, a worker needs to be observed at least once in full-time employment in each of the four consecutive 5-year periods. If a worker has completed more than one apprenticeship, we consider only the first apprenticeship to measure early-career skills. Dependent variable is mean log daily wages in a 5-year period after apprenticeship completion (e.g., Column 1 corresponds to the mean log daily wages in years 1 to 5 after apprenticeship completion). Early-career skills are measured in months of learning the respective skill during the apprenticeship. We control for the other skill groups (manual, management, admin) and worker characteristics (nationality, age fixed effects, and pre-apprenticeship educational degree). Apprenticeship controls contain year of completion, county of training establishment, and occupational field (1-digit). Robust standard errors, shown in parentheses, are clustered at the level of the apprenticeship occupation. Significance levels: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$. *Data source:* SIAB.

Returns to All Skills

Skill Interactions

Firms' Skill Demand

Robustness, Mechanisms, and Long-Run Trends

▶ Selection into apprenticeship occupations

- We always estimate returns to skills **within broad apprenticeship fields**
- In the PIAAC analysis, we account for additional **potential confounds** (e.g., school grades, family background, non-cognitive skills) PIAAC wages
- Results robust to including establishment controls or establishment FE Establishment characteristics Establishment FE

▶ Heterogeneity analyses

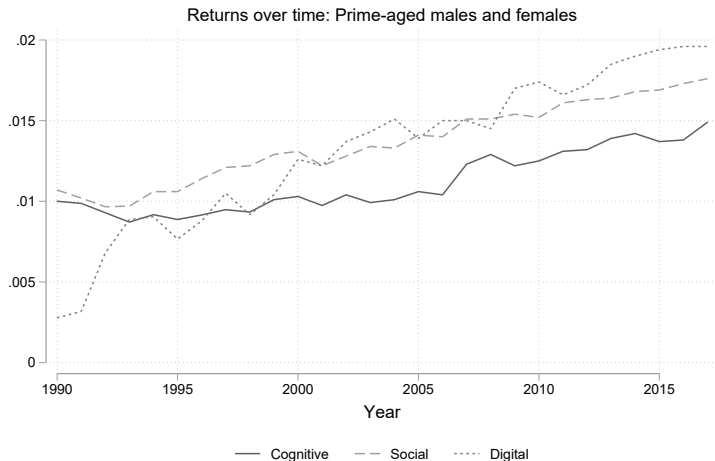

- Returns are qualitatively similar in **small and big firms** Small vs. big firms
- **Gender differences:** Women have higher returns to cognitive and social skills than men, but lower returns to digital skills Gender heterogeneity

▶ Mechanisms (Human capital investments, occupational switching)

University education On-the-job training Occupational switching

▶ Returns over time Returns by cohorts Returns over time 1990–2017

Wage Returns to Cognitive, Social, and Digital Skills: 1990–2017

Notes: Sample consists of full-time workers with a completed apprenticeship training aged 35-54 years in a given year. If a worker has completed more than one apprenticeship, we consider only the first apprenticeship to measure early-career skills. The dependent variable is log daily wages. Returns to skills are estimated separately for each year and the respective coefficients for cognitive, social, and digital skills are shown. Early-career skills are measured in months of learning the respective skill during the apprenticeship. Estimated returns are conditional on the other skill domains (manual, management, admin), worker characteristics (gender, nationality, age fixed effects, and pre-apprenticeship educational degree), and apprenticeship characteristics (year of completion, county of training establishment, and occupational field (1-digit)). *Data source:* SIAB.

Conclusion

- ▶ We derive a **detailed and comprehensive classification** of workers' early-career skills based on apprenticeship curricula in Germany
- ▶ Apprenticeships providing **higher cognitive or social skills** are associated with significantly **higher wages** in the short and longer run
 - Generalizes evidence that cognitive and social skills of high-wage workers are valued on the labor market (Deming and Kahn, 2018) to **low- and middle-wage workers**
- ▶ Higher digital skills are **not systematically related** to higher wages early in the career, but to **faster wage growth** over long-run horizons
- ▶ **Increasing trend in the labor-market returns** to cognitive, social, and particularly digital skills over the last three decades

Related Literature and Contribution

- ▶ Literature on **skill measurement**
 - U.S. O*NET: Deming (2017); task surveys in other countries: Autor (2013), ; Swedish admin data: Edin et al. (2022)
 - Based on expert assessments and/or self-reported measures, thus prone to measurement error and other survey-related drawbacks. They also mask skill heterogeneity within occupation.
 - **We derive objective, intuitive and detailed skill measures based on an established skill classification**

- ▶ Literature on **apprenticeships** (Germany and Switzerland)
 - Janssen and Mohrenweiser (2018), Eggenberger et al. (2018): study single apprenticeships or choice options in apprenticeship plans
 - Kiener et al. (2019), Kiener et al. (2020): Investigate specific apprenticeship skills
 - **We investigate the entire apprenticeship-skill landscape and use all available skill information from the apprenticeship plans**

Examples for Skill Labels in Apprenticeship Plans

Occupational Skills	Phrases in Apprenticeship Plans
Cognitive	Assessing and evaluating Examining and certifying Use technical terms in foreign languages Determine and define work steps Implementation of quality assurance measures
Social	Solve conflicts in a team Conduct customer conversations appropriate to the situation Plan and work on tasks in a team Presentation of results Contribute to the prevention of communication difficulties
Digital	Record and evaluate data relevant to the business Integrating IT systems into networks Install and configure operating systems and application programs Distinguish network architectures Use tools and test programs

Top and Bottom Apprenticeships for Cognitive, Social, and Digital Skills

Panel A: Top 3 Apprenticeships											
Cognitive Skills				Social Skills				Digital Skills			
Occupation	Cog	Dig	Soc	Occupation	Soc	Cog	Dig	Occupation	Dig	Cog	Soc
Phys. Lab. Techn.	25.38	2.13	2.23	Bank Clerk	17.61	10.70	0.95	Comp. Systems	16.49	11.91	3.46
Materials Tester	24.72	1.47	1.40	Soc. Insurance	14.07	7.44	2.32	Comp. Software	15.76	11.70	4.40
Paint Lab Techn.	24.37	3.0	0.75	Fitness Clerk	10.68	15.99	2.44	Geom. Engineer	14.42	15.74	1.38

Panel B: Bottom 3 Apprenticeships											
Cognitive Skills				Social Skills				Digital Skills			
Occupation	Cog	Dig	Soc	Occupation	Soc	Cog	Dig	Occupation	Dig	Cog	Soc
Painter	3.43	0.74	3.05	Interior Constr.	0.00	4.18	0.00	Build. Constr.	0.00	4.56	0.00
Carpenter	2.78	0.00	0.05	Chem. Worker	0.00	6.92	0.00	Track Layer	0.00	7.25	0.09
Baker	2.31	0.58	1.71	Civil Engineer	0.00	4.80	0.00	Carpenter	0.00	2.78	0.05

Notes: Table shows the ranking of the top and bottom three apprenticeships according to their cognitive, social, and digital skill content (in months) for the 165 largest apprenticeship occupations in Germany. For instance, an apprentice who has completed a Computer Scientist - System Integration (Comp. Systems) apprenticeship has learned digital skills for 16.49 months, cognitive skills for 11.91 months, and social skills for 3.46 months.

To be included in the sample, a worker needs to be observed at least once in full-time employment in each of the four consecutive 5-year periods. If a worker has completed more than one apprenticeship, we consider only the first apprenticeship to measure early-career skills. Dependent variable is mean log daily wages in a 5-year period after apprenticeship completion (e.g., Column 1 corresponds to the mean log daily wages in years 1 to 5 after apprenticeship completion). Early-career skills are measured in months; all skill measures are de-meanned. We control for the other skill groups (manual, management, admin) and worker characteristics (nationality, age fixed effects, and pre-apprenticeship educational degree). Apprenticeship controls contain year of completion, county of training establishment, and occupational field (1-digit). Robust standard errors, shown in parentheses, are clustered at the level of the apprenticeship occupation. Significance levels: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$. Data source: SIAB.

Interaction with Firms' Skill Demand

	Log daily wage					
	(1)	(2)	(3)	(4)	(5)	(6)

N (individuals × years)	721,508	721,508	721,508	721,508	721,508	721,508

Notes: Sample consists of full-time workers with a completed apprenticeship training. We only include data for the years 2014 to 2017 to ensure a direct overlap of our apprenticeship skill data with QJV data. If a worker has completed more than one apprenticeship, we consider only the first apprenticeship to measure early-career skills. Dependent variable is log daily wages. Early-career skills are measured in months and are de-meaned to facilitate interpretation. Skill demand is measured as the share of job ads in a county that requests a specific skill, standardized with mean zero and standard deviation one (see Section ??). We control for the other skill groups (manual, management, admin) and worker characteristics (nationality, age fixed effects, and pre-apprenticeship educational degree). Apprenticeship controls contain year of completion, county of training establishment, and occupational field (1-digit). Robust standard errors, shown in parentheses, are clustered at the level of the apprenticeship occupation. Significance levels: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$. Data sources: SIAB and Lightcast.

Gender Heterogeneity

F-statistic (all skills)	1.7	6.4	10.0	13.0
N (individuals)	29,374	29,374	29,374	29,374
Panel B: Large Apprenticeship Establishments				
Cognitive skills (months)	0.006 (0.0038)	0.006 (0.0036)	0.006 (0.0038)	0.009** (0.0038)
Social skills (months)	0.009** (0.0034)	0.013*** (0.0033)	0.015*** (0.0036)	0.015*** (0.0036)
Digital skills (months)	0.002 (0.0048)	0.015** (0.0058)	0.022*** (0.0074)	0.025*** (0.0080)
F-statistic (all skills)	1.6	4.9	6.2	6.1
N (individuals)	37,058	37,058	37,058	37,058
Further controls	Yes	Yes	Yes	Yes

Notes: Regression results are shown separately for workers who finished their apprenticeship in a "small" establishment (1-37 employees) in Panel A vs. a "large" establishment (38-16,870 employees) in Panel B. Size categories are based on a median split in the number of full-time employees at apprenticeship completion. Sample consists of full-time workers with a completed apprenticeship training. If a worker has completed more than one apprenticeship, we consider only the first apprenticeship to measure early-career skills. Dependent variable is log daily wages by years after apprenticeship completion (e.g., Column 1 corresponds to the mean log daily wages in years 1 to 5 after apprenticeship completion). Early-career skills are measured in months of learning the respective skill during the apprenticeship. All models control for the other skill groups (manual, management, admin), worker characteristics (nationality, age fixed effects, and pre-apprenticeship educational degree), and apprenticeship controls (year of completion, county of training establishment, and occupational field (1-digit)). Robust standard errors, shown in parentheses, are clustered at the level of the apprenticeship occupation. Significance levels: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$. Data source: SIAB.

Robustness: Accounting for Potential Confounds

Table: Apprenticeship Skills and Wages (PIAAC)

	Log hourly wages			
	(1)	(2)	(3)	(4)

Non-cognitive skills	No	No	No	Yes
F-statistic (all skills)	7.2	6.5	6.6	7.0
N (individuals)	613	613	613	613

Notes: Sample consists of full-time workers aged 35-65 years with a completed apprenticeship training. Dependent variable is log hourly wages. Early-career skills are measured in months of learning the respective skill during the apprenticeship. All specifications control for the other skill domains (manual, management, admin), worker characteristics (gender, migrant status, quadratic polynomial in age, and highest pre-apprenticeship educational degree (8 categories)), and 1-digit apprenticeship occupation fixed effects. High-school grades are final grades in math, German, and foreign language upon completing secondary education. Family background comprises the highest level of education obtained by the respondent's mother/father in three categories (no vocational or university education, vocational, university) and the occupation of the mother/father when the respondent was 15 years old (2-digit level). Non-cognitive skills include the Big 5 personality traits (openness, conscientiousness, extraversion, agreeableness, and neuroticism) and grit. Robust standard errors, shown in parentheses, are clustered at the level of the apprenticeship occupation. Significance levels: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$. Data source: PIAAC.

Robustness: Early-Career Skills and Test Scores (PIAAC)

	PIAAC Test Scores		
	Numeracy (1)	Literacy (2)	ICT (3)
Cognitive skills (months)	0.018*** (0.007)	0.014* (0.008)	0.008 (0.008)
Social skills (months)	0.021*** (0.007)	0.015* (0.008)	0.001 (0.009)
Digital skills (months)	0.032*** (0.009)	0.030** (0.012)	0.031*** (0.012)
All skills	Yes	Yes	Yes
Worker characteristics	Yes	Yes	Yes
F-statistic (all skills)	17.1	10.6	12.3
N (individuals)	1,612	1,612	1,365

Notes: Sample consists of PIAAC respondents with a completed apprenticeship training. Dependent variables are test scores in numeracy (Column 1), literacy (Column 2), problem-solving in technology-rich environments, which we refer to as ICT skills (Column 3). The smaller number of observations in Column 3 is due to the fact that ICT skills could not be tested for respondents who did not participate in PIAAC in a computer-based mode. There are three reasons for why respondents did not participate in a computer-based mode [see]Falck2020: (i) individuals had no prior computer experience, (ii) individuals failed a computer core test, which assessed basic digital competencies such as using a keyboard/mouse or scrolling through a web page, (iii) individuals refused to take part in the computer-based assessment. All test scores are standardized with standard deviation 1 in the entire PIAAC sample. Early-career skills are measured in months of learning the respective skill during the apprenticeship. All specifications control for the other skill domains (manual, management, admin) and worker characteristics (gender, migrant status, quadratic polynomial in age, and highest pre-apprenticeship educational degree (8 categories)). Robust standard errors, shown in parentheses, are clustered at the level of the apprenticeship occupation. Significance levels: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$. Data source: PIAAC.

All skills	Yes	Yes	Yes	Yes	Yes	Yes
Worker characteristics	Yes	Yes	Yes	Yes	Yes	Yes
F-statistic (all skills)	4.3	3.4	8.2	10.6	4.6	4.9
N (individuals)	1,414	1,413	1,411	1,414	1,025	1,026

Notes: Sample consists of PIAAC respondents with a completed apprenticeship training. Dependent variables measure the task content of a worker's current job in several dimensions: Simple numeracy tasks (Column 1), advanced numeracy tasks (Column 2), social tasks (Column 3), experience with computers (Column 4), computer use (Column 5), and internet use (Column 6). The smaller number of observations in Columns 5 and 6 are due to the fact that ICT task use at work questions were not asked to respondents who do not use a computer at work. The simple numeracy tasks index is based on questions examining how often a respondent performs the following activities at work: calculating costs or budgets, use or calculate fractions or percentages, use a calculator, and prepare charts, graphs, or tables. The advanced numeracy tasks index is based on questions asking how often respondents use algebra or formulas and advanced math or statistics at the job. To construct the social tasks index, we use questions asking how often respondents perform the following activities at the job: advising people, influencing people, negotiating with people, selling. The experience with computer indicator is based on a question asking whether respondents have experience with computers in their job. The computer use index is based on questions asking respondents how often they perform the following activities at work: use spreadsheets, word, programming language, and real-time discussions. The internet use index is based on questions on how often a respondent uses the internet for the following purposes: mail, acquiring work-related information, and conducting transactions. Answer categories (with the exception of the computer experience indicator) are on a 5-point scale that ranges from never to every day. Following the procedure by [?], we construct the task indices as an equally weighted average of the z-scores of the included items. The resulting index is again standardized with standard deviation 1 in the entire PIAAC sample. Early-career skills are measured in months of learning the respective skill during the apprenticeship. All specifications control for the other skill domains (manual, management, admin) and worker characteristics (gender, migrant status, quadratic polynomial in age, and highest pre-apprenticeship educational degree (8 categories)). Robust standard errors, shown in parentheses, are clustered at the level of the apprenticeship occupation. Significance levels: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$. Data source: PIAAC.

Notes: Sample consists of workers with a completed apprenticeship training whom we can follow in the first four consecutive 5-year periods after labor market entry. To be included in the sample, a worker needs to be observed at least once in full-time employment in each of the four consecutive 5-year periods. If a worker has completed more than one apprenticeship, we consider only the first apprenticeship to measure early-career skills. Dependent variable is mean log daily wages in a 5-year period after apprenticeship completion (e.g., Columns 1 and 2 correspond to the mean log daily wages in years 1 to 5 after apprenticeship completion). Early-career skills are measured in months of learning the respective skill during the apprenticeship. We control for the other skill groups (manual, management, admin) and worker characteristics (nationality, age, fixed effects, and pre-apprenticeship educational degree). Apprenticeship controls include year of completion, county of training establishment, and occupational field (1-digit). In the even columns, we add the following additional apprenticeship establishment controls: Number of full-time employees, age, industry (3-digit), and productivity (measured by AKM effects). All establishment controls are measured at the year of completing the apprenticeship. Robust standard errors, shown in parentheses, are clustered at the level of the apprenticeship occupation. Significance levels: *** p<0.01, ** p<0.05, * p<0.1. *Data source:* SIAB.

Baseline controls	Yes	Yes	Yes	Yes
High-school grades	No	Yes	Yes	Yes
Family background	No	No	Yes	Yes
Non-cognitive skills	No	No	No	Yes

Note: Sample consists of full-time workers aged 35-65 years (Panel A) or aged 16-39 years (Panel B) with a completed apprenticeship training. Dependent variable is an indicator of training on the job, which takes a value of 1 if the person has participated in an on-the-job training during the 12 months prior to the survey, and 0 otherwise. Early-career skills are measured in months of learning the respective skill during the apprenticeship. Baseline controls include the other skill domains (manual, management, admin), worker characteristics (gender, migrant status, quadratic polynomial in age, and highest educational degree (8 categories)), and 1-digit apprenticeship occupation fixed effects. High-school grades are final grades in math, German, and foreign language upon completing secondary education. Family background comprises the highest level of education obtained by the respondent's mother/father in three categories (no vocational or university education, vocational, university) and the occupation of the mother/father when the respondent was 15 years old (2-digit level). Non-cognitive skills include the Big 5 personality traits (openness, conscientiousness, extraversion, agreeableness, and neuroticism) and grit. Robust standard errors, shown in parentheses, are clustered at the level of the apprenticeship occupation. Significance levels: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$. Data source: PIAAC.

Mechanisms: Occupational Switching

	Occupational switching after			
	1–5 yrs (1)	6–10 yrs (2)	11–15 yrs (3)	16–20 yrs (4)
Cognitive skills (months)	-0.004 (0.0035)	-0.001 (0.0033)	0.000 (0.0036)	0.002 (0.0038)
Social skills (months)	-0.018*** (0.0047)	-0.014*** (0.0041)	-0.018*** (0.0046)	-0.023*** (0.0050)
Digital skills (months)	-0.011 (0.0080)	-0.001 (0.0081)	0.000 (0.0071)	0.005 (0.0055)
All skills	Yes	Yes	Yes	Yes

F-statistic (all skills)	2.9	2.9	3.4	6.0
N (individuals)	66,432	66,432	66,432	66,432

Notes: Sample consists of full-time workers with a completed apprenticeship training whom we can follow in the first four consecutive 5-year periods after labor market entry. To be included in the sample, a worker needs to be observed at least once in full-time employment in each of the four consecutive 5-year periods. If a worker has completed more than one apprenticeship, we consider only the first apprenticeship to measure early-career skills. Dependent variable is a binary indicator of occupational switching, taking a value of 1 if a worker is observed at least once in an occupation different from the apprenticeship occupation (4-digit level) in the period indicated in the column header, and 0 otherwise. Early-career skills are measured in months of learning the respective skill during the apprenticeship. We control for the other skill groups (manual, management, admin) and worker characteristics (gender, nationality, age fixed effects, and pre-apprenticeship educational degree). Apprenticeship controls contain year of completion, county of training establishment, and occupational field (1-digit). Robust standard errors, shown in parentheses, are clustered at the level of the apprenticeship occupation. Significance levels: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$. Data source: SIAB.

Returns by Cohort

Notes: Sample consists of individuals with a completed apprenticeship training who work full-time in a given year. If a worker has completed more than one apprenticeship, we consider only the first apprenticeship to measure early-career skills. The dependent variable is log daily wages. Returns to skills are estimated separately for each labor market entry cohort indicated in the graph by potential experience bin. Potential experience is defined as the number of years elapsed since a worker finished her apprenticeship. Early-career skills are measured in months of learning the respective skill during the apprenticeship. Estimated returns are conditional on the other skill domains (manual, management, admin), worker characteristics (gender, nationality, age fixed effects, and pre-apprenticeship educational degree), and apprenticeship characteristics (year of completion, county of training establishment, and occupational field (1-digit)). *Data source:* SIAB.

Deming & Kahn, 2018: Categorization of Open Text Fields in BGT Data

Description of Job Skills

Job Skills	Keywords and Phrases
Cognitive	Problem solving, research, analytical, critical thinking, math, statistics
Social	Communication, teamwork, collaboration, negotiation, presentation
Character	Organized, detail oriented, multitasking, time management, meeting deadlines, energetic
Writing	Writing
Customer service	Customer, sales, client, patient
Project management	Project management
People management	Supervisory, leadership, management (not project), mentoring, staff
Financial	Budgeting, accounting, finance, cost
Computer (general)	Computer, spreadsheets, common software (e.g., Microsoft Excel, PowerPoint)
Software (specific)	Programming language or specialized software (e.g., Java, SQL, Python)

NOTE.—Shown is the authors categorization of open text fields in Burning Glass Technologies data.
