 - Lack of human capital
 - Entry barriers
 - Incorrect beliefs
 - Attitudes/prejudices
 - \rightarrow Possible solution: facilitate employers' learning (e.g. exposure by working together for a short period of time)

Does exposure to a refugee increase local employers' hiring of refugees?

Refugees

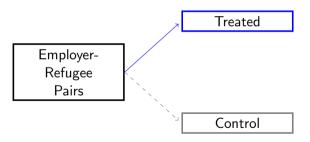

- A large disadvantaged group in many societies
- Unemployment rates higher than natives and other migrants
- Cost: human capital, political, economic
- Forced displacement lasting for many years: investing in their integration as a policy tool

This study

- Randomized experiment in Uganda, *one of the largest* refugee-host country in the world and *largest* in Africa
 - Refugee workers with employable skills
 - Micro and small firms active in urban markets where refugees' skills can be employed

This study

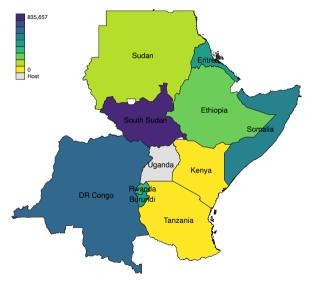

- Randomized experiment in Uganda, *one of the largest* refugee-host country in the world and *largest* in Africa
 - Refugee workers with employable skills
 - Micro and small firms active in urban markets where refugees' skills can be employed

■ Treated employers: internship to one refugee for one week. Control employers: no meeting with the refugee worker

Context

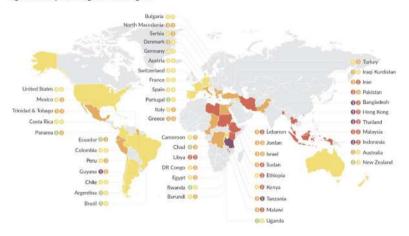

Refugees' origin

Source: UNHCR 2022

Policy support globally, de jure and de facto

Figure 2. Map of refugees' work rights

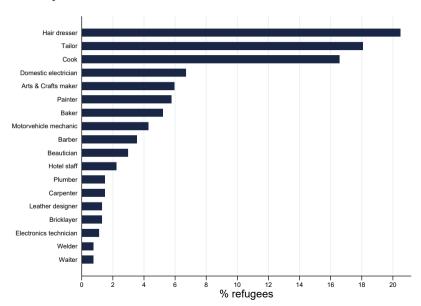

Countries are shaded based on their overall de facto score in the 2021 Refugee Access to Work Rights Dataset. Countries are listed with their de jure score, left, and de facto score. Source: Ginn et al (2022). 2022 Global Refugee Work Rights Report.

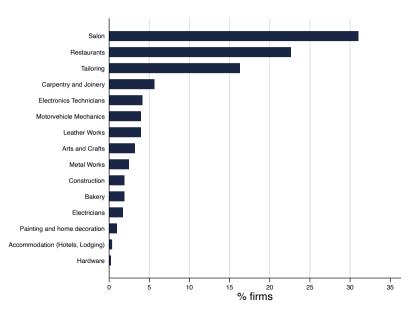

Kampala

- This experiment: carried out in Kampala Map firms and refugees
 - Host to approximately 8.5% total refugees in the country UNHCR 2022
 - Host to 44% of all business establishments and almost 50% of all non-agricultural jobs in Uganda Sladoje et al 2019
- Descriptive evidence from pilot: refugees in two of largest cities (Kampala and Mbarara) are more educated and more likely to look for jobs (Evidence from pilot)
- Comparing refugees with natives in Kampala: refugees more educated, but less employed and earn less Comparison with UNRHS 2018

Refugees' occupations

Firms' sectors

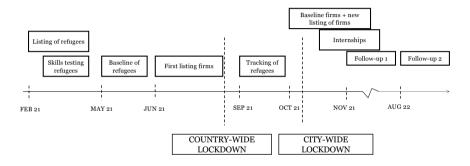

Skills test Certificates

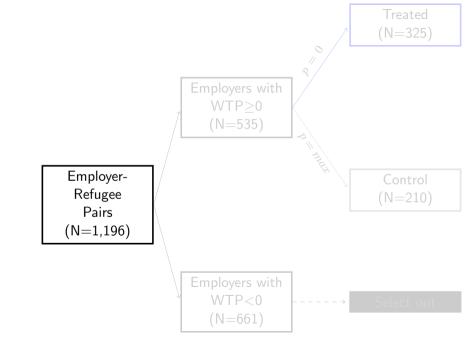

Timeline and data

Timeline

Experiment protocol

CVs of refugee worker: an example

Wisdom Karungu

Resident: Kampala, Nsambya, since: 2015

Age: 34

Expertise: cook

Years of experience as a cook: 8

Gender: Male

Nationality: Congolese

Knowledge of English (self-reported scale 1-5):

Reading:	Speaking:	Writing:	Listening:
3=Moderately well	2=Not well	2=Not well	3=Moderately well

Knowledge of Luganda (self-reported scale 1-5):

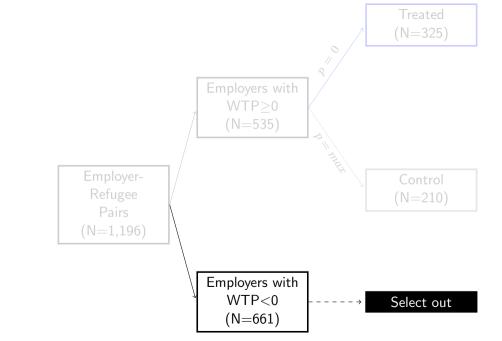

Reading:	Speaking:	Writing:	Listening:
3=Moderately well	3=Moderately well	1=Not at all	3=Moderately well

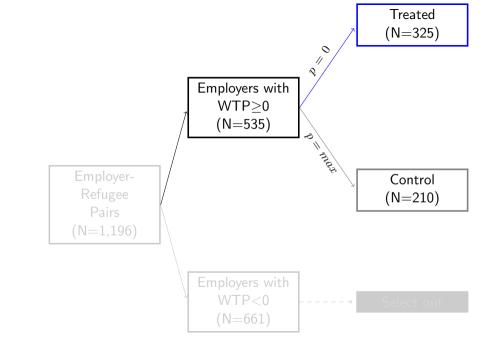

WTP elicitation

- Show CVs
- Multiple Price List (BDM elicitation) WTP Script
 - Would you be willing to hire this worker for one week under probation starting up to 8 days from today if you:
 - 1. can hire him/her for free
 - **2.** have to pay him/her a salary of [5,000]UGX?
 - 3. have to pay him/her a salary of [10,000]UGX?

..

21. have to pay him/her a salary of [100,000]UGX?

Randomization into treatment and control

- Envelope with random price (incentive-compatible mechanism) Burchardi et al 2021:
 - w = 0: The salary you found is lower (or equal) than the salary you stated as the maximum salary you are willing to pay for the worker. Congratulations, you can hire this worker!
 - w = 100,000: The salary you found is above the salary you stated as the maximum salary you are willing to pay for this worker. I am sorry, but you can not hire this worker.

Descriptives of firms Descriptives of refugees Firms that select in vs those who select out Refugees re-matched

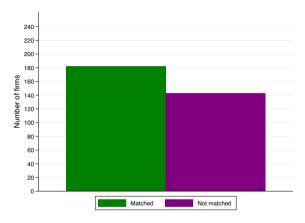

The matching process

■ Appointment by phone (one to three days before) with both refugee and firm

Trial protocol: take up and randomization check

- Refugee compliance problematic if workers are selected on firm characteristics
- But the refugees did not know anything about the firms they were matched to (besides location of meeting point) Refugees that show up at the internship

Trial protocol: take up and randomization check

- Two samples Compare samples Unmatched firms
 - Full sample (535 firms): intention-to-treat effect of the experiment
 - Exposed sample (392 firms): effect of exposure
- Balance checks Balance
- Attrition checks Attrition

Outcome variables

Experiment investigates how exposure, based on observing 1 refugee for 1 week:

- Affects demand for new refugees
- Affects the firm's beliefs about refugees' skills and abilities

Outcome variables

Experiment investigates how exposure, based on observing 1 refugee for 1 week:

- Affects demand for new refugees
- Affects the firm's beliefs about refugees' skills and abilities

Outcomes:

- Number of refugees hired after experiment
- Willingness to hire a refugee (dummy if non-negative)
 - New hypothetical refugee worker, characteristics similar across CVs: Age=26yo; Experience=4y; Knowledge of lang=4 out of 5; Nationality=Congolese
- Expected quality of refugees in terms of
 - hard skills (theoretical, practical and unit performance)
 - soft skills (time management, team work, work ethics, trust, respect)

lacktriangle Worker's output a contains info regarding group mean θ : $a=f(\theta,\varepsilon)$

- Worker's output a contains info regarding group mean θ : $a = f(\theta, \varepsilon)$
- **E**xposure produces signal on the worker's ability: s = a

- Worker's output a contains info regarding group mean θ : $a = f(\theta, \varepsilon)$
- **Exposure** produces signal on the worker's ability: s = a
- Firm cannot observe group component, but has biased prior beliefs about it: $m_0 < \theta$

Conceptual framework

- Worker's output a contains info regarding group mean θ : $a = f(\theta, \varepsilon)$
- **Exposure** produces signal on the worker's ability: s = a
- Firm cannot observe group component, but has biased prior beliefs about it: $m_0 < \theta$
- lacktriangle Firm's willingness to hire refugee is a function of initial beliefs about heta

Conceptual framework

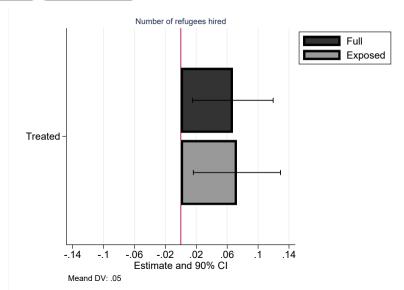

- \blacksquare Worker's output a contains info regarding group mean θ : $a=f(\theta,\varepsilon)$
- **Exposure** produces signal on the worker's ability: s = a
- Firm cannot observe group component, but has biased prior beliefs about it: $m_0 < \theta$
- lacktriangle Firm's willingness to hire refugee is a function of initial beliefs about heta
 - → Firm will update beliefs upwards
 - \rightarrow Firm's willingness to hire will increase

Example: normally distributed beliefs

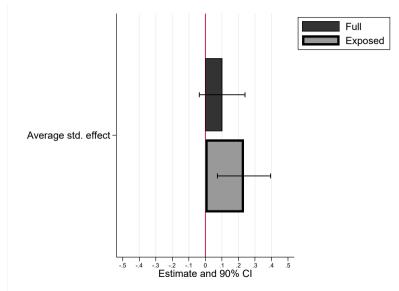

Main Results

More refugees hired 8 months after exposure

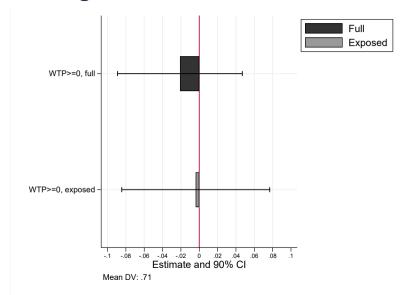

Not driven by matched worker No displacement effects

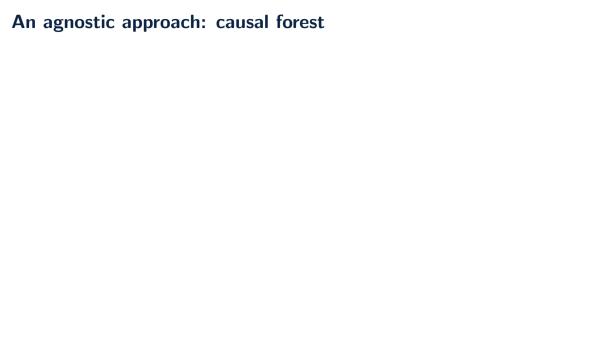

Employers update about refugees' skills Components

But no clear average effect on demand in the short-term Curves

Why is there no average effect on the demand for refugees in the short run?

An agnostic approach: causal forest

■ Let the data speak about heterogeneous treatment effects

An agnostic approach: causal forest

- Let the data speak about heterogeneous treatment effects
- Feed algorithm with baseline attributes and indices using factor analysis

An agnostic approach: causal forest

- Let the data speak about heterogeneous treatment effects
- Feed algorithm with baseline attributes and indices using factor analysis
 - Refugee's characteristics (refugee's ability, initial attitudes, and more)
 - Firm's characteristics (size and willingness to expand (i.e. has vacancies), initial beliefs, initial attitudes, and more)
 - Match-related characteristics (same neighborhood, same gender)

Firms' and workers' characteristics

What is a causal forest

Investigate heterogeneity

- Dividing sample in high predicted CATE vs low predicted CATE (top and bottom 50%). Balance test various characteristics across two groups, correcting for Familywise Error Rate, using List, Shaikh, and Zu (2015) Athey et al, 2021; Carlana et al 2022
 - Additional robustness check: best linear projection: $\tau(X) = \beta_0 + \beta 1 * X$ using doubly robust estimator Chernozhukov et al, 2018

Causal forest

Attitudes

Firm's attitudes:

- Agrees or agrees very much with the statement: "When jobs are scarce, Ugandans should have priority above refugees"
- Says no to the following question: "Do you think that refugees should be allowed to work in Uganda?"

Refugee's attitudes: Agrees or agrees very much with the statements (coded in the same direction):

- Ugandans discriminate towards refugees
- I assume that in general, Ugandans have only the best intentions
- Work between Ugandans and refugees is good for both groups
- I see myself similar to a Ugandan

- Suppose employers have to exert effort to learn about a refugee's skills
 - The higher their effort \rightarrow the more they will learn

- Suppose employers have to exert effort to learn about a refugee's skills
 - \blacksquare The higher their effort \rightarrow the more they will learn
- Employers have a taste parameter, indicating attitudes towards refugee workers
 - lacktriangle The more positive the attitudes o the higher the return to learning, and thus higher effort to learn

- Suppose employers have to exert effort to learn about a refugee's skills
 - The higher their effort \rightarrow the more they will learn
- Employers have a taste parameter, indicating attitudes towards refugee workers
 - lacktriangle The more positive the attitudes ightarrow the higher the return to learning, and thus higher effort to learn
- Refugees' have attitudes towards natives, affect effort at work

 - lacktriangleright Refugees with positive attitudes o high effort on the job o firms update more about workers' skills. Viceversa, when refugees have negative attitudes
- Positive match: employer with positive attitudes + refugee worker with positive attitudes. Predictions: update beliefs $\uparrow \rightarrow$ willingness to hire refugees \uparrow
- Negative match: employer with negative attitudes + refugee worker with negative attitudes. Predictions: little or no learning \rightarrow willingness to hire refugees \downarrow ?; No change?

Positive vs negative contact

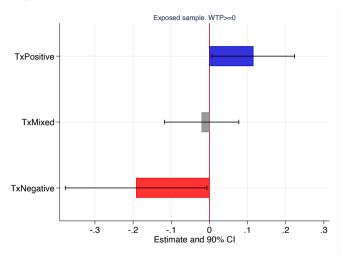

- Theory and lab experiments from social psychology
- Contact hypothesis: contact with a member of a stigmatized group improves relationship with members of that group
- Negative contact experiences can exacerbate rather than improve intergroup relations
 - "As early as 1954, Allport warned that the 'wrong' kinds of contact could "...strengthen the adverse mental associations that we have" (p.264), prompting an increase in negative emotions and stereotypes" (McKeown and Dixon 2017)
 - Polarizing effects of positive and negative contact experiences (Barlow et al 2012; Paolini et al 2010)

Positive vs negative contact

- Theory and lab experiments from social psychology
- Contact hypothesis: contact with a member of a stigmatized group improves relationship with members of that group
- Negative contact experiences can exacerbate rather than improve intergroup relations
 - "As early as 1954, Allport warned that the 'wrong' kinds of contact could "...strengthen the adverse mental associations that we have" (p.264), prompting an increase in negative emotions and stereotypes" (McKeown and Dixon 2017)
 - Polarizing effects of positive and negative contact experiences (Barlow et al 2012; Paolini et al 2010)
- Negative match: employer with negative attitudes + refugee worker with negative attitudes. Predictions: little or no learning → willingness to hire refugees ↓

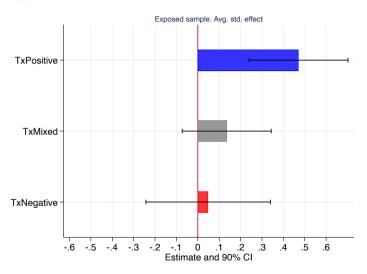

Demand for refugees and initial attitudes

 $\rightarrow \uparrow$ when matching with the right attitudes; \downarrow when negative

Beliefs updating by initial attitudes Components

Real hiring by initial attitudes

Conclusion

- We run a randomized experiment to understand whether contact in the workplace affects firms' demand for disadvantaged workers with huge policy relevance: refugees
- Exposure increases number of refugees hired, especially when the employer-employee match was with positive attitudes
- Results can be explained combining models of learning and social psychology theories
 - → Exposure generates long-term effect on firms' demand for refugee workers.
 - ightarrow Initial attitudes matter in the workplace: how locals and refugees perceive each other matters for the quality of exposure

Describe causal forest Davis and Heller, 2017 (Back)

- lacktriangle Idea based on random forests: predict individual outcome Y_i using mean Y of observations sharing similar X
- lacktriangle What is similar? "Leaves" of observations, created splitting sample with certain values of X
- Split decided by "goodness-of-fit" criterion, such as MSE
- lacksquare Split until "terminal leaf" l, assigning $\hat{y_i} = \bar{y_l}$
- Penalty to avoid over-fitting using cross-validation
- Reduce variance bootstrapping creating many trees, that is: a forest. Individual outcome is given by averages of all \hat{y}_i across trees
- Causal forest: maximize variance of treatment effects across leaves minus penalty for within-leaf variance. CATEs are given by $\hat{\tau}_l = y_{Tl} y_{Cl}$

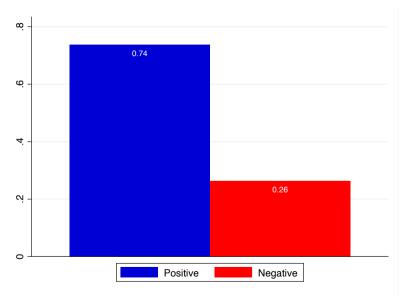

Indices Back

- Refugee's ability: cognitive skills; years of education; years of experience in tested occupation; result on the skills test.
- Refugee's knowledge of languages: can speak Luganda or English
- Refugee's level of integration: has ever been employed by a Ugandan

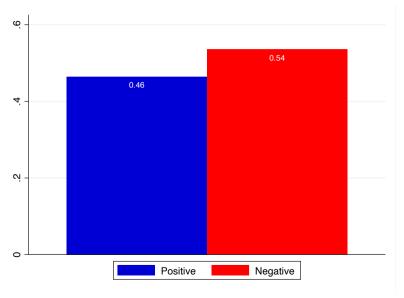

Indices Back

- Firm's size: number of employees; number of tasks conducted in the firm; number of rooms in main business premises
- Firm's initial beliefs: what score do you think the typical refugee job seeker in Kampala would get on the DIT test?
- Firm's experience interacting with any foreigner: has ever hired a migrant
- Firm's perceived cost of learning about refugees: days it takes to learn about the hard skills and the soft skills of a refugee; believes that refugees would not be able to pass the skills test
- Firm's quality: owns business premises; is formal; keeps accounting books, separate bank accounts and advertise regularly products/services

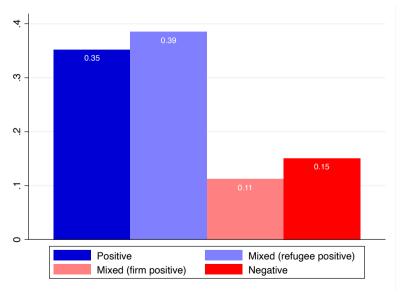

Firms' attitudes (Back)

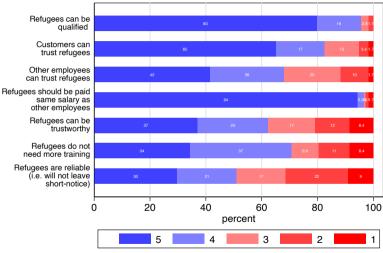

Refugees' attitudes (Back)

Firms by firms' attitudes and refugees' attitudes (Back)

What firms think about refugees (pilot evidence) (Back)

5 = 'Totally agree' 1 = 'Not agree at all'

Outcomes: real hirings (Back)

- Have you offered work on probation to any worker since January 2022?
- If yes, to how many workers have you offered work on probation?
- How many were from Uganda?
- How many were refugees?

Outcomes: skills Back

- For the next set of questions, I want you to think about the typical refugee job seeker in Kampala. Think about this worker's ...
 - ... theoretical knowledge (e.g.theoretical skills that are relevant to work in a firm like yours).
 - ... practical skills (e.g. technical skills that can be applied to work in a firm like yours). ...
 - ... performance at work (e.g. in terms of number of units serviced, quantity, number of pieces completed, etc.). ...
 - ... time management ability (i.e. the ability of completing an assigned task meeting a deadline). ...
 - ... team work ability (i.e. the ability of working in a team with other employees). ...
 - ... work ethics (i.e. discipline and hard-work abilities). ...
- On a scale between 1 and 5, where 1= "Terrible" and 5= "Excellent", how do you think would this person perform?

Outcomes: trust Back

■ How much do you think you could trust this worker? Use a scale between 1 and 5, where 1="Not at all" and 5="Very much".

Outcomes: respect Back

■ How much do you think this worker would respect you? Use a scale between 1 and 5, where 1="Not at all" and 5="Very much".

Outcomes: WTP new worker Back

Christelle Bahati

Resident: Kampala, Makindye, since: 2020

Age: 26

Expertise: cook

Years of experience as a cook: 4

Gender: Woman

Nationality: Congolese

Knowledge of English (self-reported scale 1-5):

Reading:	Speaking:	Writing:	Listening:
4=Well	4=Well	4=Well	4=Well

Knowledge of Luganda (self-reported scale 1-5):

Reading:	Speaking:	Writing:	Listening:
4=Well	4=Well	4=Well	4=Well

Outcomes: WTP new worker Back

- Would you be willing to hire this worker for one week under probation starting up to 8 days from today if you:
 - 1. can hire him/her for free
 - 2. have to pay him/her a salary of [5,000]UGX?
 - 3. have to pay him/her a salary of [10,000]UGX?

...

21. have to pay him/her a salary of [100,000]UGX?

Script for WTP exercise Back

Before moving on with the explanation, I would like you to think about the following situation: imagine a job seeker come to look for a job at your firm. Usually, after getting some information on her, you might already have in mind what you would be willing to pay to hire her. In other words, you might think about what is the maximum price at which you would still hire the worker. Since you do not know the salary at which she would be willing to work for you, the salary you think about is usually your own valuation of the worker. Talking to her, you learn about the actual salary she wants to receive and you decide whether to hire her or not. Your decision will depend on the salary the worker is willing to accept: if the salary is higher than your valuation, you will not hire the worker. If instead the salary is equal or lower than your valuation, you will hire her.

We will ask you to form your own valuation about the maximum salaries you would pay for one worker looking to work for you for one week of probation. [This worker is hypothetical, i.e. s/he does not exist, although her characteristics are very similar to the types of workers we have interviewed few months ago.]

Script for WTP exercise Back

[...] After you have thought about this salary, we will present you a list of 21 possible salaries for this worker for one week of work [...]

Once you have answered all these questions, you will be given an envelope with a price like this one [Enumerator: show the envelope]. This price is between 0 and 100,000UGX. The price has been randomly selected by the computer and I DO NOT KNOW IT, NEITHER I COULD

CHANGE IT. [...]

Conceptual framework Back

- Experiment investigates how exposure affects the firm's beliefs about refugees' skills and abilities based on observing 1 refugee for 1 week
- Refugee worker's ability: $a = \theta + \varepsilon$, with $\varepsilon \sim N(0, \sigma_{\varepsilon}^2)$
- \blacksquare Firm wants to infer θ from observing a
- lacksquare Firm has normally distributed prior beliefs about group mean: $N(m_0,\sigma_0^2)$
- Firm's prior beliefs are biased Survey evidence on biased firm beliefs
- Profit from hiring a refugee is: $\Pi = a w$

Conceptual framework

- Signal from hiring: $s = a = \theta + \varepsilon$
- Updated beliefs are given by $m_1 = \alpha s + (1 \alpha)m_0$, where

$$\sigma_1^2 = \sigma_0^2 \frac{\sigma_\varepsilon^2}{\sigma_0^2 + \sigma_\varepsilon^2} < \sigma_0^2$$

and

$$\alpha = \frac{\sigma_1^2}{\sigma_2^2}$$

- Average beliefs in the treatment group: $E[m_1] = \alpha\theta + (1-\alpha)m_0$
- Assume a firm's WTP is a positive function of the firm's expected profit

$$E[\Pi] = E(m_1) - w$$

Conceptual framework: attitudes matter?

- \blacksquare Firms have attitudes, δ , where δ is a measure of attitudes towards refugees
- lacktriangle Learning is costly and a function of effort, c(e)
- Firm's expected utility is given by

$$E(U) = E(\Pi) - \delta - c(e)$$

- Firm's problem: chose effort and then update beliefs
- Solve problem working backwards

Conceptual framework: why do attitudes matter?

- New signal: $s^{'}=\theta+\varepsilon+\nu$, with $\nu\sim N(0,\sigma_{\nu}^{2}(e))$ measurement error, such that $\sigma_{\nu}^{2'}(e)<0$
- Update beliefs as follows:

$$m_1(e) = \alpha' s + (1 - \alpha') m_0$$

where

$$\alpha' = \frac{\sigma_1^2(e)}{\sigma_{\varepsilon}^2 + \sigma_{\nu}^2(e)}$$

Conceptual framework: why do attitudes matter?

- New signal: $s'=\theta+\varepsilon+\nu$, with $\nu\sim N(0,\sigma_{\nu}^2(e))$ measurement error, such that $\sigma_{\nu}^{2'}(e)<0$
- Update beliefs as follows:

$$m_1(e) = \alpha' s + (1 - \alpha') m_0$$

where

$$\alpha' = \frac{\sigma_1^2(e)}{\sigma_s^2 + \sigma_n^2(e)}$$

- lacktriangle Higher effort leads to more precision (lpha' higher) and thus less weight on prior
- First stage: firm choses effort to learn about the refugee during the internship
- From participation constraint note that a firm will not exert effort if:

$$E[m_1(e)] - w - c(e) < \delta \quad \forall e$$

Conceptual framework: why do attitudes matter? Back

- Prediction 2: With costly learning, there will be two types of firms:
 - Positive attitudes $(E[m_1(e^*)] w c(e^*) \ge \delta) \to \text{exert effort to learn} \to \text{update beliefs}$ positively (in expectation) $\to \text{increase demand for a generic refugee}$
 - Negative attitudes $(E[m_1(e)] w c(e) < \delta \quad \forall e) \rightarrow \text{exert no effort to learn} \rightarrow \text{update beliefs less than low group (in expectation)} \rightarrow \text{smaller increase in demand for a generic refugee compared to low group}$
