job creation effect of UI through wages

# Motivation

- broad context: equilibrium labor market effects of UI benefits
- standard models:

job creation effect of UI through wages

- literature mostly concerned with extraordinary UI policy measures
  - UI extensions during the Great Recession
  - FPUC (US) during the Covid-19 pandemic

# This Paper

# This Paper

- studies the wage effect of an increase in the UI benefit rate:

$$\frac{\Delta \bar{w}}{\Delta \bar{b}}$$

in non-emergency context

# This Paper

- studies the wage effect of an increase in the UI benefit rate:

$$\frac{\Delta \bar{w}}{\Delta \bar{b}}$$

in non-emergency context

- using Austrian social security data to
  - highlight the predicted **impact of UI entitlement** on  $\frac{\Delta \bar{w}}{\Delta \bar{b}}$  (theory)
  - propose a test for the theory (empirics)

# This Paper

- studies the wage effect of an increase in the UI benefit rate:

$$\frac{\Delta \bar{w}}{\Delta \bar{b}}$$

in non-emergency context

- using Austrian social security data to
  - highlight the predicted **impact of UI entitlement** on  $\frac{\Delta \bar{w}}{\Delta \bar{b}}$  (theory)
  - propose a test for the theory (empirics)
- closest paper is Jäger, Schoefer, Young, and Zweimüller (2020)

Comparison to Jäger et al. (2020)

# This Paper: Part 1 Theory

# This Paper: Part 1 Theory

- putting together multiple pieces that already exist in the literature

UI entitlement in the literature

# This Paper: Part 1 Theory

- putting together multiple pieces that already exist in the literature

UI entitlement in the literature

- using a simple Mortensen-Pissarides model with UI benefit expiration:

$$\text{UI benefit expiration rate } \uparrow \implies \frac{\Delta \bar{w}}{\Delta b} \downarrow$$

# This Paper: Part 1 Theory

- putting together multiple pieces that already exist in the literature

UI entitlement in the literature

- using a simple Mortensen-Pissarides model with UI benefit expiration:

$$\text{UI benefit expiration rate } \uparrow \implies \frac{\Delta \bar{w}}{\Delta b} \downarrow$$

- when calibrated: impact may be substantial

# This Paper: Part 1 Theory

- putting together multiple pieces that already exist in the literature

UI entitlement in the literature

- using a simple Mortensen-Pissarides model with UI benefit expiration:

$$\text{UI benefit expiration rate } \uparrow \implies \frac{\Delta \bar{w}}{\Delta b} \downarrow$$

- when calibrated: impact may be substantial
- decomposition of  $\frac{\Delta \bar{w}}{\Delta b}$  to highlight
  - the heterogeneity of  $\frac{\Delta \bar{w}}{\Delta b}$  by UI entitlement status
    - effect is **negative** for individuals **without UI entitlement**
  - the two channels through which the UI expiration rate affects  $\frac{\Delta \bar{w}}{\Delta b}$

## This Paper: Part 2 Empirics

## This Paper: Part 2 Empirics

- 2001 Austrian UI reform: change in the UI benefit calculation formula

## This Paper: Part 2 Empirics

- 2001 Austrian UI reform: change in the UI benefit calculation formula
- within a sample of individuals for whom  $b_{post} > b_{pre}$

## This Paper: Part 2 Empirics

- 2001 Austrian UI reform: change in the UI benefit calculation formula
  - within a sample of individuals for whom  $b_{post} > b_{pre}$
  - I compare
    - the reemployment wages of post-reform UI claimants  
(who started a UI claim in the month following the reform)
- TO
- the reemployment wages of pre-reform UI-claimants  
(who started a UI claim in the month leading up to the reform)

## This Paper: Part 2 Empirics

- 2001 Austrian UI reform: change in the UI benefit calculation formula
  - within a sample of individuals for whom  $b_{post} > b_{pre}$
  - I compare
    - the reemployment wages of post-reform UI claimants  
(who started a UI claim in the month following the reform)
- TO
- the reemployment wages of pre-reform UI-claimants  
(who started a UI claim in the month leading up to the reform)
  - using observations from surrounding years as a control group

## This Paper: Part 2 Empirics

- 2001 Austrian UI reform: change in the UI benefit calculation formula
  - within a sample of individuals for whom  $b_{post} > b_{pre}$
  - I compare
    - the reemployment wages of post-reform UI claimants  
(who started a UI claim in the month following the reform)
- TO
- the reemployment wages of pre-reform UI-claimants  
(who started a UI claim in the month leading up to the reform)
  - using observations from surrounding years as a control group
  - to find that post-reform UI claimants have higher reemployment wages than pre-reform UI claimants
    - in accordance with what the theory predicts
    - although the difference is only marginally statistically significant

# Theory

---

# Conceptual framework

# Conceptual framework

- model à la Mortensen and Pissarides (1994)
  - exogenous job separations
  - wage renegotiation only by mutual agreement
  - UI benefits indexed to the pre-separation wage (for calibration)

# Conceptual framework

- model à la Mortensen and Pissarides (1994)
  - exogenous job separations
  - wage renegotiation only by mutual agreement
  - UI benefits indexed to the pre-separation wage (for calibration)
- introducing UI benefit entitlement
  - within the set of unemployed individuals  $\mathcal{U}$ 
    - $\implies$  there is a subset of individuals  $\mathcal{U}_0$  without UI entitlement
  - upon separation from employer
    - $\implies$  individual becomes entitled for UI benefit receipt
  - when unemployed with UI entitlement
    - $\implies$  individual loses entitlement for UI benefit receipt at rate  $\xi$

# Wage determination

# Wage determination

- wage is determined through Nash bargaining
  - worker's threat point: continuation of current unemployment spell
  - both parties have some bargaining power

# Wage determination

- wage is determined through Nash bargaining
  - worker's threat point: continuation of current unemployment spell
  - both parties have some bargaining power

⇒ worker's share of match surplus depends on

- worker's impatience regarding date of (re)employment  $T$

# Current versus Potential Future unemployment income

# Current versus Potential Future unemployment income

# Current versus Potential Future unemployment income

- the bargained wage can be written as a function of two terms:

$$w = \phi(\mathbf{B}, \mathbf{B}')$$

where the  $\mathbf{B}$  terms are expected discounted income flows when unemployed:

- $\mathbf{B}$  → during the **current unemployment spell  $U$**   
(before getting (re)employed)
- $\mathbf{B}'$  → during **potential future unemployment spells  $U'$**   
(after getting (re)employed)

# Current versus Potential Future unemployment income

- the bargained wage can be written as a function of two terms:

$$w = \phi(B, B')$$

where the  $B$  terms are expected discounted income flows when unemployed:

- $B$  → during the **current unemployment spell**  $U$   
(before getting (re)employed)
- $B'$  → during **potential future unemployment spells**  $U'$   
(after getting (re)employed)

- besides other forms of unemployment income

# Current versus Potential Future unemployment income

- the bargained wage can be written as a function of two terms:

$$w = \phi(B, B')$$

where the  $B$  terms are expected discounted income flows when unemployed:

$B$  → during the **current unemployment spell  $U$**   
(before getting (re)employed)

$B'$  → during **potential future unemployment spells  $U'$**   
(after getting (re)employed)

- besides other forms of unemployment income
  - $B$  includes UI benefits  $b$  **only** in the case of individuals **with** UI entitlement

# Current versus Potential Future unemployment income

- the bargained wage can be written as a function of two terms:

$$w = \phi(\mathbf{B}, \mathbf{B}')$$

where the  $\mathbf{B}$  terms are expected discounted income flows when unemployed:

$\mathbf{B}$  → during the **current unemployment spell  $U$**   
(before getting (re)employed)

$\mathbf{B}'$  → during **potential future unemployment spells  $U'$**   
(after getting (re)employed)

- besides other forms of unemployment income
  - $\mathbf{B}$  includes UI benefits  $b$  **only** in the case of individuals **with** UI entitlement
  - $\mathbf{B}'$  includes UI benefits  $b$  regardless of UI entitlement status

## Partial wage effects of *current* (+) versus *future* (-) unemployment income

## Partial wage effects of *current* (+) versus *future* (-) unemployment income

- the partial (i.e. ceteris paribus) wage effect

## Partial wage effects of *current* (+) versus *future* (-) unemployment income

- the partial (i.e. ceteris paribus) wage effect
  - of **current** unemployment income is **positive**  $\frac{\partial w}{\partial B} > 0$  because
    - an increase in income during the current unemployment spell  $B \uparrow$ 
      - ↓
      - makes the worker **less impatient** regarding the date of (re)employment
        - ↓
        - worker asks for a higher wage  $w \uparrow$

## Partial wage effects of *current* (+) versus *future* (-) unemployment income

- the partial (i.e. ceteris paribus) wage effect
  - of **current** unemployment income is **positive**  $\frac{\partial w}{\partial B} > 0$  because
    - an increase in income during the current unemployment spell  $B \uparrow$
    - ↓
    - makes the worker **less impatient** regarding the date of (re)employment
    - ↓
    - worker asks for a higher wage  $w \uparrow$
  - of **future** unemployment income is **negative**  $\frac{\partial w}{\partial B'} < 0$  because
    - an increase in income during future unemployment spells  $B' \uparrow$
    - ↓
    - makes the worker **more impatient** regarding the date of (re)employment
    - ↓
    - worker accepts a lower wage  $w \downarrow$

## Partial wage effects of *current* (+) versus *future* (-) unemployment income

- the partial (i.e. ceteris paribus) wage effect
  - of **current** unemployment income is **positive**  $\frac{\partial w}{\partial B} > 0$  because
    - an increase in income during the current unemployment spell  $B \uparrow$ 
      - $\downarrow$
      - makes the worker **less impatient** regarding the date of (re)employment
        - $\downarrow$
        - worker asks for a higher wage  $w \uparrow$
    - of **future** unemployment income is **negative**  $\frac{\partial w}{\partial B'} < 0$  because
      - an increase in income during future unemployment spells  $B' \uparrow$ 
        - $\downarrow$
        - makes the worker **more impatient** regarding the date of (re)employment
          - $\downarrow$
          - worker accepts a lower wage  $w \downarrow$
  - the effect through **current** unemployment income is **greater** in magnitude

$$\left| \frac{\partial w}{\partial B} \right| > \left| \frac{\partial w}{\partial B'} \right|$$

primarily because of discounting and uncertainty about the future.

## Heterogeneity in partial wage effect of increasing the UI benefit rate

## Heterogeneity in partial wage effect of increasing the UI benefit rate

- consider a ceteris paribus increase in flat UI benefit rate  $b \uparrow$

## Heterogeneity in partial wage effect of increasing the UI benefit rate

- consider a ceteris paribus increase in flat UI benefit rate  $b \uparrow$
- $b$  may affect  $w$  through two terms: decomposition
  - current unemployment income  $B$
  - potential future unemployment income  $B'$

## Heterogeneity in partial wage effect of increasing the UI benefit rate

- consider a ceteris paribus increase in flat UI benefit rate  $b \uparrow$
- $b$  may affect  $w$  through two terms: **decomposition**
  - current unemployment income  $B$
  - potential future unemployment income  $B'$
- for individuals **with** UI entitlement the partial wage effect is **positive**:

$$\frac{\partial w_i}{\partial b} \Big|_{i \notin \mathcal{U}_0} = \underbrace{\frac{\partial w_i}{\partial B_i}}_{>0} \times \underbrace{\frac{\partial B_i}{\partial b} \Big|_{i \notin \mathcal{U}_0}}_{>0} + \underbrace{\frac{\partial w_i}{\partial B'_i}}_{<0} \times \underbrace{\frac{\partial B'_i}{\partial b}}_{>0} > 0$$

effect through **current** unemployment income      effect through **future** unemployment income

because  $\frac{\partial B_i}{\partial b} \approx \frac{\partial B'_i}{\partial b}$  and  $\left| \frac{\partial w}{\partial B} \right| > \left| \frac{\partial w}{\partial B'} \right|$ .

# Heterogeneity in partial wage effect of increasing the UI benefit rate

- consider a ceteris paribus increase in flat UI benefit rate  $b \uparrow$
- $b$  may affect  $w$  through two terms: **decomposition**
  - current unemployment income  $B$
  - potential future unemployment income  $B'$
- for individuals **with** UI entitlement the partial wage effect is **positive**:

$$\frac{\partial w_i}{\partial b} \Big|_{i \notin \mathcal{U}_0} = \underbrace{\overbrace{\frac{\partial w_i}{\partial B_i} > 0} \times \overbrace{\frac{\partial B_i}{\partial b} \Big|_{i \notin \mathcal{U}_0} > 0}}_{\text{effect through current unemployment income}} + \underbrace{\overbrace{\frac{\partial w_i}{\partial B'_i} < 0} \times \overbrace{\frac{\partial B'_i}{\partial b} > 0}}_{\text{effect through future unemployment income}} > 0$$

because  $\frac{\partial B_i}{\partial b} \approx \frac{\partial B'_i}{\partial b}$  and  $\left| \frac{\partial w}{\partial B} \right| > \left| \frac{\partial w}{\partial B'} \right|$ .

- for individuals **without** UI entitlement the partial wage effect is **negative**:

$$\frac{\partial w_i}{\partial b} \Big|_{i \in \mathcal{U}_0} = \underbrace{\overbrace{\frac{\partial w_i}{\partial B_i} > 0} \times \overbrace{\frac{\partial B_i}{\partial b} \Big|_{i \in \mathcal{U}_0} = 0}}_{\text{effect through current unemployment income}} + \underbrace{\overbrace{\frac{\partial w_i}{\partial B'_i} < 0} \times \overbrace{\frac{\partial B'_i}{\partial b} > 0}}_{\text{effect through future unemployment income}} = \underbrace{\overbrace{\frac{\partial w_i}{\partial B'_i} < 0} \times \overbrace{\frac{\partial B'_i}{\partial b} > 0}}_{\text{effect through future unemployment income}} < 0$$

## Numerical results

- add indexation of UI benefits to pre-separation wage

## Numerical results

- add indexation of UI benefits to pre-separation wage
- calibrate the model using Austrian data **Calibration**
  - random sample of individuals aged between 25 and 55 in year 2001

## Numerical results

- add indexation of UI benefits to pre-separation wage
- calibrate the model using Austrian data **Calibration**
  - random sample of individuals aged between 25 and 55 in year 2001
- change in the UI replacement rate:

$$\begin{array}{ccc} 0.5 & \longrightarrow & 0.6 \\ \text{(policy regime } p_0) & & \text{(policy regime } p_1) \end{array}$$

## Numerical results

- add indexation of UI benefits to pre-separation wage
- calibrate the model using Austrian data **Calibration**
  - random sample of individuals aged between 25 and 55 in year 2001
- change in the UI replacement rate:

$$\begin{array}{ccc} 0.5 & \longrightarrow & 0.6 \\ \text{(policy regime } p_0) & & \text{(policy regime } p_1) \end{array}$$

- report  $\frac{\Delta \bar{w}}{\Delta b}$ 
  - with and without effect on labor market tightness

$$\text{Partial Effect} = \frac{\mathbb{E}[w | p_1, \theta_{p_0}] - \mathbb{E}[w | p_0, \theta_{p_0}]}{\mathbb{E}[b | p_1, \theta_{p_0}] - \mathbb{E}[b | p_0, \theta_{p_0}]}$$

$$\text{Total Effect} = \frac{\mathbb{E}[w | p_1, \theta_{p_1}] - \mathbb{E}[w | p_0, \theta_{p_0}]}{\mathbb{E}[b | p_1, \theta_{p_1}] - \mathbb{E}[b | p_0, \theta_{p_0}]}$$

- also by UI entitlement status

# Numerical results

## Decomposition of the impact of $\xi$ on the average partial wage effect

---

	All	UI- eligibles	UI- ineligibles
<hr/>			
$\xi = 0.0 \left( \frac{u_0}{u} = 0.37, \frac{w_{p0}}{y} = 0.66 \right)$			
Partial Effect	0.293	0.562	-0.194
Total Effect	0.179	0.506	-0.407
$\xi = 0.0047 \left( \frac{u_0}{u} = 0.61, \frac{w_{p0}}{y} = 0.6 \right)$			
Partial Effect	0.0323	0.191	-0.0473
Total Effect	0.0297	0.189	-0.05

---

The model ignores many important but (plausibly orthogonal) effects like increased separation rates documented by Hartung, Jung, & Kuhn (2022) in the context of the Hartz reforms.

## Empirics: testing the theory

---

# Context: 2001 Austrian UI reform

Replacement Rate

Average Change

## Context: 2001 Austrian UI reform

Replacement Rate

Average Change

- introduction of a new benefit calculation formula on 1st of January, 2001  
→ for new UI claims

## Context: 2001 Austrian UI reform

Replacement Rate

Average Change

- introduction of a new benefit calculation formula on 1st of January, 2001
  - for new UI claims
- for median and below-median earners
  - gross UI replacement rate increased from 0.44 to 0.48
  - average monthly UI benefits increased by 300-400 ATS ( $\approx$  25 EUR) and up to 700 ATS ( $\approx$  50 EUR) for some

# Context: 2001 Austrian UI reform

Replacement Rate

Average Change

- introduction of a new benefit calculation formula on 1st of January, 2001
  - for new UI claims
- for median and below-median earners
  - gross UI replacement rate increased from 0.44 to 0.48
  - average monthly UI benefits increased by 300-400 ATS ( $\approx$  25 EUR) and up to 700 ATS ( $\approx$  50 EUR) for some
- Austria is an ideal context for testing the theory:
  - non-binding sectoral wage floors
  - no experience rating
  - possibility to claim UI benefits even in the case of quitting

# Theoretical prediction: framework

## Theoretical prediction: framework

- consider a progressively introduced increase in flat UI benefits:  $b_{post} > b_{pre}$

$$b(T_{job\ loss}) = \begin{cases} b_{pre} & \text{if } T_{job\ loss} < T_{reform} \\ b_{post} & \text{if } T_{job\ loss} > T_{reform} \end{cases}$$

## Theoretical prediction: framework

- consider a progressively introduced increase in flat UI benefits:  $b_{post} > b_{pre}$

$$b(T_{job\ loss}) = \begin{cases} b_{pre} & \text{if } T_{job\ loss} < T_{reform} \\ b_{post} & \text{if } T_{job\ loss} > T_{reform} \end{cases}$$

- expected reemployment wage of individual  $i$  as a function of the time of job loss:

$$w_i(T_{job\ loss}) = \phi_i(B_i(T_{job\ loss}), B'_i(T_{job\ loss}), T_{job\ loss})$$

## Theoretical prediction: framework

- consider a progressively introduced increase in flat UI benefits:  $b_{post} > b_{pre}$

$$b(T_{job\ loss}) = \begin{cases} b_{pre} & \text{if } T_{job\ loss} < T_{reform} \\ b_{post} & \text{if } T_{job\ loss} > T_{reform} \end{cases}$$

- expected reemployment wage of individual  $i$  as a function of the time of job loss:

$$w_i(T_{job\ loss}) = \phi_i(B_i(T_{job\ loss}), B'_i(T_{job\ loss}), T_{job\ loss})$$

where

## Theoretical prediction: framework

- consider a progressively introduced increase in flat UI benefits:  $b_{post} > b_{pre}$

$$b(T_{job\ loss}) = \begin{cases} b_{pre} & \text{if } T_{job\ loss} < T_{reform} \\ b_{post} & \text{if } T_{job\ loss} > T_{reform} \end{cases}$$

- expected reemployment wage of individual  $i$  as a function of the time of job loss:

$$w_i(T_{job\ loss}) = \phi_i(\mathbf{B}_i(T_{job\ loss}), \mathbf{B}'_i(T_{job\ loss}), T_{job\ loss})$$

where

- the current unemployment income term  $\mathbf{B}_i(T_{job\ loss})$  writes

$$\mathbf{B}_i(T_{job\ loss}) = \begin{cases} \mathbf{B}_{i,pre}(T_{job\ loss}) & \text{if } T_{job\ loss} < T_{reform} \\ \mathbf{B}_{i,post}(T_{job\ loss}) & \text{if } T_{job\ loss} > T_{reform} \end{cases}$$

with a **jump discontinuity** at  $T_{job\ loss} = T_{reform}$ .

# Theoretical prediction: framework

- consider a progressively introduced increase in flat UI benefits:  $b_{post} > b_{pre}$

$$b(T_{job\ loss}) = \begin{cases} b_{pre} & \text{if } T_{job\ loss} < T_{reform} \\ b_{post} & \text{if } T_{job\ loss} > T_{reform} \end{cases}$$

- expected reemployment wage of individual  $i$  as a function of the time of job loss:

$$w_i(T_{job\ loss}) = \phi_i(B_i(T_{job\ loss}), B'_i(T_{job\ loss}), T_{job\ loss})$$

where

- the current unemployment income term  $B_i(T_{job\ loss})$  writes

$$B_i(T_{job\ loss}) = \begin{cases} B_{i,pre}(T_{job\ loss}) & \text{if } T_{job\ loss} < T_{reform} \\ B_{i,post}(T_{job\ loss}) & \text{if } T_{job\ loss} > T_{reform} \end{cases}$$

with a **jump discontinuity** at  $T_{job\ loss} = T_{reform}$ .

- and the future unemployment income term  $B'_i(T_{job\ loss})$  writes

$$B'_i(T_{job\ loss}) = \begin{cases} B'_{i,pre}(T_{job\ loss}) & \text{if } T_{job\ loss} < T_{reform} \\ B'_{i,post}(T_{job\ loss}) & \text{if } T_{job\ loss} > T_{reform} \end{cases}$$

with a **no jump discontinuity** at  $T_{job\ loss} = T_{reform}$ .

# Theoretical prediction: discontinuity

# Theoretical prediction: discontinuity

- the reemployment wage of individual  $i$  if job loss occurs **just before**  $T_{reform}$ :

$$w_{i,pre} = \lim_{T_{job\ loss} \uparrow T_{reform}} w_i(T_{job\ loss}) = \phi_i(\mathbf{B}_{i,pre}(T_{reform}), \mathbf{B}'_{i,post}(T_{reform}), T_{reform})$$

# Theoretical prediction: discontinuity

- the reemployment wage of individual  $i$  if job loss occurs **just before**  $T_{reform}$ :

$$w_{i,pre} = \lim_{T_{job\ loss} \uparrow T_{reform}} w_i(T_{job\ loss}) = \phi_i(\mathbf{B}_{i,pre}(T_{reform}), \mathbf{B}'_{i,post}(T_{reform}), T_{reform})$$

- the reemployment wage of individual  $i$  if job loss occurs **just after**  $T_{reform}$ :

$$w_{i,post} = \lim_{T_{job\ loss} \downarrow T_{reform}} w_i(T_{job\ loss}) = \phi_i(\mathbf{B}_{i,post}(T_{reform}), \mathbf{B}'_{i,post}(T_{reform}), T_{reform})$$

# Theoretical prediction: discontinuity

- the reemployment wage of individual  $i$  if job loss occurs **just before**  $T_{reform}$ :

$$w_{i,pre} = \lim_{T_{job\ loss} \uparrow T_{reform}} w_i(T_{job\ loss}) = \phi_i(\mathbf{B}_{i,pre}(T_{reform}), \mathbf{B}'_{i,post}(T_{reform}), T_{reform})$$

- the reemployment wage of individual  $i$  if job loss occurs **just after**  $T_{reform}$ :

$$w_{i,post} = \lim_{T_{job\ loss} \downarrow T_{reform}} w_i(T_{job\ loss}) = \phi_i(\mathbf{B}_{i,post}(T_{reform}), \mathbf{B}'_{i,post}(T_{reform}), T_{reform})$$

- taking the difference and scaling by the change in UI benefits yields:

$$\frac{w_{i,post} - w_{i,pre}}{b_{post} - b_{pre}} \approx \underbrace{\frac{\partial w_i}{\partial \mathbf{B}_i} \times \frac{\partial \mathbf{B}_i}{\partial b}}_{\text{effect through current unemployment income}}$$

(first-order approximation)

## Theoretical prediction: size

## Theoretical prediction: size

- using the same model
  - calibrated using the sample for diff-in-diff analysis **Calibration**

## Theoretical prediction: size

- using the same model
  - calibrated using the sample for diff-in-diff analysis **Calibration**
- simulate labor market histories (employment, wages, UI entitlement)  
around an unanticipated change in UI replacement rate from 0.5 to 0.6

# Theoretical prediction: size

- using the same model
  - calibrated using the sample for diff-in-diff analysis [Calibration](#)
- simulate labor market histories (employment, wages, UI entitlement) around an unanticipated change in UI replacement rate from 0.5 to 0.6
- when considering a 50-day window for  $T_{job\ loss}$  around  $T_{reform}$   
→ values for

$$\frac{\mathbb{E}[w \mid T_{job\ loss} \geq T_{reform}] - \mathbb{E}[w \mid T_{job\ loss} < T_{reform}]}{\mathbb{E}[b \mid T_{job\ loss} \geq T_{reform}] - \mathbb{E}[b \mid T_{job\ loss} < T_{reform}]}$$

range from **0.3** ( $\xi = 0.0065$ ) up to **0.8** ( $\xi = 0$ ). [details](#)

# Empirical strategy

# Empirical strategy

# Empirical strategy

# Empirical strategy

# Empirical strategy

# Empirical strategy: difference-in-differences

## Empirical strategy: difference-in-differences

$$W_i = \beta_P \cdot \mathbf{Post}_i + \beta_{P \times R} \cdot \mathbf{Post}_i \cdot \mathbf{Reform}_i + \sum_{y \in \mathcal{Y}} \beta_y \cdot \mathbb{1} [Y(i) = y] + \mathbf{X}'_i \zeta + \epsilon_i$$

where:

- $W_i$  is the reemployment wage
- $\mathcal{Y}$  is the set of sample-years  $\mathcal{Y} \equiv \{1999, 2000, 2001, 2002, 2003, 2004\}$
- $\mathbf{Post}$  is an indicator for the UI claim starting on or after the 1st of January:

$$\mathbf{Post}_i = \mathbb{1} [T_{UI \text{ claim start}}(i) \geq \mathbf{January 1st of } Y(i)]$$

- $\mathbf{Reform}$  is an indicator for the sample-year being 2001:

$$\mathbf{Reform}_i = \mathbb{1} [Y(i) = 2001]$$

- and  $\mathbf{X}$  is a vector of covariates. Covariates

# Sample

- summary statistics by sub-sample
  - demographics and earnings
    - by *Post* × *Reform*: 20 40 20 (1 obs./ind.) 40 (1 obs./ind.)
    - by sample-year *Y*: 20 40 20 (1 obs./ind.) 40 (1 obs./ind.)
  - distribution across sectors: 20 40 20 (1 obs./ind.) 40 (1 obs./ind.)
  - distribution across states: 20 40 20 (1 obs./ind.) 40 (1 obs./ind.)
  - distribution of  $T_{UI \text{ claim start}}$ : UI claim starting week
- great degree of similarity between *Reform* and *Control*
  - partly not surprising because of overlaps across *Y*: 20 days 40 days
    - due to high share of seasonal workers: Seasonal share  
≈ 26% with the conservative criterion of Del Bono and Weber (2008)
    - individuals who regularly claim UI benefits

# Difference-in-Differences Estimation Results

# Difference-in-Differences Estimation Results

- $\hat{\beta}_{P \times R}$  for the difference in reemployment wages is estimated using OLS
- baseline estimates: [table](#) [figure](#)
  - range from 100 ATS (bandwidth  $\approx 30$  days) to 700 ATS (BW  $\approx 20$  days)
  - for bandwidths of  $\approx 20$  days
    - marginally statistically significant with non-robust SE estimates
  - when keeping only 1 observation per individual [table](#) [figure](#)
    - slightly larger and statistically significant estimates  
(to be taken with a grain of salt!)

# Difference-in-Differences Estimation Results

- $\hat{\beta}_{P \times R}$  for the difference in reemployment wages is estimated using OLS
- baseline estimates: [table](#) [figure](#)
  - range from 100 ATS (bandwidth  $\approx 30$  days) to 700 ATS (BW  $\approx 20$  days)
  - for bandwidths of  $\approx 20$  days
    - marginally statistically significant with non-robust SE estimates
  - when keeping only 1 observation per individual [table](#) [figure](#)
    - slightly larger and statistically significant estimates (to be taken with a grain of salt!)
- robustness:
  - varying main covariates [all](#) [1 obs. per individual](#)  
 $\implies$  results remain unchanged
  - leaving out one year from the control group [all](#) [1 obs. per individual](#)  
 $\implies$  results vary slightly

# PLACEBO Difference-in-Differences Estimation Results

# PLACEBO Difference-in-Differences Estimation Results

- redoing the same exercise with
    - 2000 and 2002 being assigned to placebo reform
    - 1999, 2003, 2004 assigned to placebo control
  - placebo estimates: [table](#) [figure](#)
    - smaller / closer to zero: vary between -300 ATS and 200 ATS
    - regardless of whether performing the analysis
      - with all observations (multiple observations per individual)
      - with only 1 observation per individual [table](#) [figure](#)
- none of the estimates is statistically significantly different from zero

# Comparison to Jäger, Schoefer, Young, and Zweimüller (2020)

## This Paper

- in contrast to Jäger et al. (2020):
  - findings **consistent with theory** although statistically weak
- however not directly comparable because of
  - different strategy / comparison:
    - in my sample there are many regular UI-claimants
    - Jäger et al. (2020) focus on individuals with stable employment
  - lower statistical power:
    - I have data for only 1 reform
    - Jäger et al. (2020) have data for 4 different reforms

# Appendix

---

# Literature: job creation effect of UI benefits through wages

Back

- job creation effect of UI benefits:
  - old topic:  
Ehrenberg and Oaxaca (1976)
  - renewed interest following UI-extensions during the Great Recession:  
Hagedorn, Karahan, Manovskii, and Mitman (2013), Lalive, Landais, and Zweimüller (2015), Landais, Michailat, and Saez (2018), Chodorow-Reich, Coglianesi, and Karabarbounis (2019), Fredriksson and Söderström (2020)
  - current interest following emergency FPUC during the Covid-19 pandemic:  
Ganong, Noel, and Vavra (2020), Marinescu, Skandalis, and Zhao (2021), Finamor and Scott (2021)
- wage effect of UI-**extensions**: theoretically and empirically **ambiguous**  
Schmieder, Wachter, and Bender (2016), Nekoei and Weber (2017)
- wage effect of UI benefit **rate**: *a priori* unambiguously **positive**
  - Jäger, Schoefer, Young, and Zweimüller (2020) find **zero** effect  
⇒ **contradicts** standard theory

- most UI systems (Tatsiramos and Van Ours, 2014)
  - condition receipt of UI benefits on prior (recent) employment (contribution)
  - limit the duration of UI benefit entitlement while unemployed (finite potential benefit duration)
- old idea of an entitlement effect:
  - prospect of gaining access to UI
    - ⇒ additional incentive for labor market participation (Hamermesh, 1979)
  - negative effect of future potential UI benefits on current wages (Beissinger et al., 2004, in the context of union wage bargaining)
- UI benefits are not the only source of income while unemployed
  - especially if potential benefit durations are short (Jäger et al. (2020); Chodorow-Reich et al. (2019))

## Arbitrarily set (targeted) values

	General Sample	Analysis Sample
$\theta_{p_0}$ [labor market tightness]	0.135	0.135
$\left(\frac{\alpha u}{v}\right)$ [targeted labor share]	0.6	0.6
$\rho$ [time discount rate]	0.0001	0.0001
$\gamma$ [worker bargaining power]	0.1	0.1
$\eta$ [matching elasticity]	0.9	0.9
$\frac{\delta}{\delta + \mu}$ [separation rate divided by employment outflow rate]	0.67	0.67

## Estimated values

	General Sample	Analysis Sample
$f_{p_0}$ [job finding rate]	0.00716	0.0173
$\delta_{\min}$ [lower bound on separation rate]	0.000427	0.00366
$(\delta + \mu)$ [total employment outflow rate]	0.00135	0.00707
$\hat{\xi}$ [est. UI expiration rate]	0.0047	0.0065

## Indirectly assigned (implied) values

	General Sample	Analysis Sample
$\delta$ [separation rate]	0.000905	0.00474
$\nu$ [working population renewal rate]	0.000445	0.00233
$\mu$ [matching efficiency]	0.00875	0.0211
$\frac{c}{v}$ [vacancy cost share]	14.6	7.15
$\frac{z}{v}$ [unemployment amenity share]	0.103	0.203
$\frac{z}{v}$ [ineligible unemployment income share]	0.213	0.218

	Sample from the population (*)	Sample used in the analysis (**)
employment outflow rate ( $\delta + \nu$ )	.00135 (.0012)	.00707 (.00495)
job separation lower bound ( $\delta_{\min}$ )	.000427 (.000469)	.00366 (.00323)
employment inflow rate ( $f$ )	.00716 (.00856)	.0173 (.0188)
UI benefit expiration rate ( $\xi$ )	.0047 (.00288)	.0065 (.00483)
Avg. number of obs.	35,607	13,707

(\*) Random sample drawn from the population of individuals who are between 25 and 55 in 2001.

(\*\*) Sample used for the analysis about the effect of the 2001 UI reform.

- consider a ceteris paribus increase in flat UI benefit rate  $b \uparrow$
- the overall partial effect on the wage  $w$  of a given individual  $i$  can be written as:

$$\frac{\partial w_i}{\partial b} = \underbrace{\frac{\overset{>0}{\partial w_i}}{\partial B_i} \times \frac{\partial B_i}{\partial b}}_{\text{effect through current unemployment income}} + \underbrace{\frac{\overset{<0}{\partial w_i}}{\partial B'_i} \times \frac{\partial B'_i}{\partial b}}_{\text{effect through future unemployment income}}$$

- effect through future unemployment income

⇒ all individuals regardless of current UI entitlement status

$$\frac{\partial B'_i}{\partial b} > 0 \text{ for all individuals}$$

- effect through current unemployment income

⇒ only individuals who are currently entitled to receive UI benefits

$$\Rightarrow \frac{\partial B_i}{\partial b} > 0 \text{ for individuals **with** current UI entitlement } i \notin \mathcal{U}_0$$

$$\Rightarrow \frac{\partial B_i}{\partial b} = 0 \text{ for individuals **without** current UI entitlement } i \in \mathcal{U}_0$$

- under flat UI benefits, the average partial effect  $\frac{\partial \bar{w}}{\partial b}$  is a **weighted average** of
  - the partial effect for individuals **with** UI entitlement  $\left. \frac{\partial w_i}{\partial b} \right|_{i \notin \mathcal{U}_0}$  weighted by the share of individuals with UI entitlement
  - and the partial effect for individuals **without** UI entitlement  $\left. \frac{\partial w_i}{\partial b} \right|_{i \in \mathcal{U}_0}$  weighted by the share of individuals without UI entitlement
- $\xi \uparrow$  affects the average partial effect  $\frac{\partial \bar{w}}{\partial b}$  through two channels

- relative attenuation:**

$b$  represent a smaller share of  $B$

pushes the partial effect towards zero in the case of both groups

**ambiguous sign**

- composition:**

higher share of individuals without UI entitlement

higher share of individuals with negative partial effect

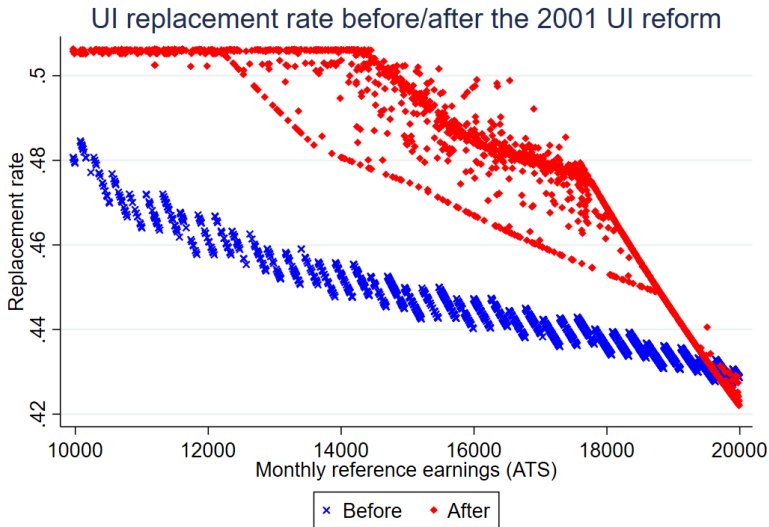

**negative sign**

---

	Assuming static expectations about the evolution of the job finding rate	Using the post-reform equilibrium job finding rate
$\xi = 0.0 \quad \left( \frac{u_0}{u} = 0.41, \quad \frac{w_{p0}}{y} = 0.64 \right)$	0.783	0.77
$\xi = 0.0065 \quad \left( \frac{u_0}{u} = 0.56, \quad \frac{w_{p0}}{y} = 0.6 \right)$	0.324	0.314

---

$$\frac{\mathbb{E}[w \mid \mathbf{T}_{\text{job loss}} \geq \mathbf{T}_{\text{reform}}] - \mathbb{E}[w \mid \mathbf{T}_{\text{job loss}} < \mathbf{T}_{\text{reform}}]}{\mathbb{E}[b \mid \mathbf{T}_{\text{job loss}} \geq \mathbf{T}_{\text{reform}}] - \mathbb{E}[b \mid \mathbf{T}_{\text{job loss}} < \mathbf{T}_{\text{reform}}]}$$

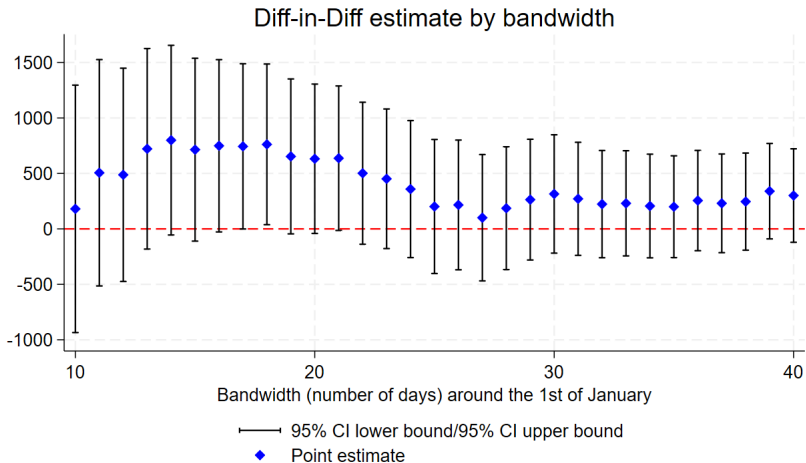

# 2001 Austrian UI Reform: Average Change

[Back](#)

- reference earnings (Y-2);
- indicator for white-collar employment;
- indicator for Austrian citizenship (Y-2);
- indicator for gender interacted with
  - a cubic polynomial of age;
  - a cubic polynomial of employment days during the 18m before  $T_{UI \text{ claim start}}$ ;
- time-to-entry fixed effects (3 categories);
- sector fixed effects (20 categories);
- state (Bundesland) fixed effects (7 categories).
