Introduction

- Mortgages play a central role in the transmission of monetary policy.
 - For many households, mortgage debt is the most important liability.
 - Fluctuations in interest rates and required debt servicing can have a large impact on the cash available for non-housing consumption.
- The speed and magnitude of the monetary policy transmission depends on the type of mortgages, eg. ARMs vs. fixed rates products, eg. Auclert (2019); Beraja et al. (2019); Eichenbaum et al. (2022); Garriga et al. (2017), among others.
- We study mortgage refinancing in the recent period of monetary tightening, using the UK setting.
 - Most products are offered at a discounted interest rate for 2 or 5 year fixed products, after which the rate reverts to a higher level. Borrowers typically refinance at the end of the discounted rate window
 - Identification: September 2022 mini-budget announcement → sudden and large increase in swap and mortgage rates; magnitude (approx. 200 basis points), and salience

Preview of results, after the mini-budget announcement:

- There is a large shift towards shorter fixation periods:
 - Borrowers are 20 percentage points more likely to select 2-year products instead of 5-year ones,
 - despite 2-year products becoming 10 basis points more expensive than 5-year ones.
 - Borrowers prioritize financial flexibility. \rightarrow Implications for the future monetary transmission.
- Borrowers are less likely to switch lenders.
 - Higher likelihood of refinancing with the same lender.
 - Borrowers do not need to go through an affordability assessment when refinancing with the same lender → Implications for mortgage market competition.
- Deleveraging
 - Average decrease in loan to value of around 4 percentage points or roughly 8% of the pre-event value.

Preview of results, after the mini-budget announcement:

• Borrower heterogeneity:

- Relation between borrower characteristics and mortgage contract choices
- Higher incidence of lender switches among higher income households and those with a joint borrower.
- Consistent with the notion that these less constrained households are more likely to pass the affordability assessment required at the time of a lender switch.
- Importance of financial flexibility
 - 2-year products are more flexible, in that they can be refinanced sooner and with lower early repayment charges in the fixed period.
 - Provide evidence on the exercise of flexibility by borrowers in shorter fixation loans (using a longer time period).
 - Trade-off between insurance (interest rate fixation) and flexibility.

Data

- Mortgage originations, PSD001
 - For most of the analysis, administrative dataset covering the universe of UK originated residential mortgages
 - Focus on refinancing, excluding loans for property acquisition
 - Restrict to 2-year and 5-year fixed rate remortgages
 - Internal and external refinancing data available from 2021 Q2 onwards
 - Loan type, amount, interest rate, lender, property postcode, date of birth of the borrower etc.
- Mortgages on offer in the market, Moneyfacts data
 - Comprehensive view of available mortgage products at any point in time
 - Lender, loan type, interest rate, maximum LTV, etc.
- Loan performance data, PSD007
 - Administrative dataset with bi-annual snapshots of all outstanding mortgages
 - Loans on the books of lenders: status, amount, property postcode, date of birth of the borrower
 - For providing evidence on the use of flexibility by borrowers in 2-year and 5-year fixed rate loans

Conclusion

References

Mini-budget event and methodology

• Mini-budget:

- Announced on 23 September 2022 as part of the UK Chancellor's Growth Plan
- Large unfunded tax cuts proposed
- Plan received with skepticism by markets
- Large unexpected increase in swap and mortgage interest rates

• Approach:

- Compare refinancing choices before and after Mini Budget announcement
- Narrow +/-120 days window around the event (results robust to narrower windows)
- How do the large differences in mortgage costs relate to refinancing outcomes?

How to interpret the results?

- Financial flexibility:
 - Products with shorter fixation terms are more flexible (lower early repayment charges)
 - Flexibility matters for borrowers who want to change the terms of the loan (home moves, equity extraction or loan repayment)
 - Use the loan performance data (PSD007) to show evidence on the use of flexibility by borrowers in different types of loans
 - Bi-annual snapshot of all loans in the portfolio of lenders. Use the combination of property postcode and date of birth of borrower to identify and track borrowers in a given property *a*cross all lenders.
 - Cohort analysis: first cohort, loans first originated in 2015H1.
 - Kaplan-Meier survival analysis for loan outcomes (home moves, equity extraction, loan repayments)
- Uncertainty
- Interest rate expectations

Uncertainty

• Are mortgage choice results driven by uncertainty?

 \rightarrow Mortgage choice results robust to estimating main specification splitting the first vs. second 60 days in post-period, where uncertainty is back to pre-period levels

Interest rate expectations

- For some evidence to separate financial flexibility motives from interest rate expectations, we:
 - Examine market interest rate expectations (rates rose more than expected at mini-budget, and expectation of decline after but only moderate) and household inflation expectations (2 vs. 5 year inflation expectations not significantly different)
 - Examine ARMs: rise in ARMs following mini-budget, however this is driven by tracker rather than discounted variable rate mortgages, the former having lower ERCs and offering more flexibility

Financial Flexibility and Insurance

Conclusion

References

Conclusion

- After an unexpected and significant interest rate rise:
 - borrowers are more likely to choose short-fixation (2-year fixed) loans
 - fewer borrowers switch lender
 - deleveraging
- Trade-off between interest rate exposure and financial flexibility:
 - borrowers prioritise flexibility \rightarrow implications for the future monetary policy transmission

Uncertainty

28 / 42

Uncertainty

- The event triggered significant uncertainty
- Uncertainty \rightarrow demand for flexibility
- Are the effects driven by higher interest rates (first moments) or higher uncertainty (second moments)?
- The two are not mutually exclusive, and generally hard to separate them, but it is not only about second moments:
 - No significant increase in the number of borrowers on reversion at around the time of the event (greatest flexibility)
 - The uncertainty soon subsided, but mortgage refinancing outcomes are similar.

Expectations

- Are the results driven by an expectation of a decline in interest rates?
- If interest rates are expected to decline, then flexibility to change the loan terms is more valuable.
- Limited data on household expectations, the one that exist on inflation expectations

Mini-budget methodology

Mini-budget event and methodology

• Challenge:

- Many post-event remortgages based on pre-existing offers
- Borrowers may request an offer from lenders prior to the refinancing date
- Offers typically remain valid for 3 months

• Solution:

- Use Moneyfacts data to distinguish between pre- and post-offers among the post remortgagors
- For each (lender × LTV × mortgage type) combination, calculate the *maximum* rate offered pre Mini Budget and the *minimum* rate post Budget
- For most cases, *maximum* rate offered pre Mini Budget < *minimum* rate offered post Budget
- $\rightarrow\,$ use the product type, lender identity, loan interest rate to distinguish pre-event offers (= lower rates) from post-event offers.
