# Equalising Monetary Policy The Earnings Heterogeneity Channel in Action

Martin Groiss

Goethe University Frankfurt

EEA ESEM 2024 - Rotterdam

August 27, 2024

Results and Sub-Channels 0000000

# Motivation

- Unconventional monetary policy has unintended effects:
  - $\rightarrow$  direct effects: capital income
  - $\rightarrow$  indirect effects: wages
- Monetary stimulus increases job creation
- > 70% of income from labour earnings (HFCS, 2014)

# Earnings Heterogeneity Channel

- Earnings of high-income and low-income workers may respond differently to monetary policy
- Expansionary monetary policy is...
  - equalising: poor households' wages are more affected by recessions through changes in unemployment (Krueger et al., 2010)
  - dis-equalising: poor households' wages are stickier (Ko, 2015), the skill-premium increases (Dolado et al., 2021) and jobs for low-skilled workers (Faia et al., 2023)

# Earnings Heterogeneity Channel

- Earnings of high-income and low-income workers may respond differently to monetary policy
- Expansionary monetary policy is...
  - equalising: poor households' wages are more affected by recessions through changes in unemployment (Krueger et al., 2010)
  - dis-equalising: poor households' wages are stickier (Ko, 2015), the skill-premium increases (Dolado et al., 2021) and jobs for low-skilled workers (Faia et al., 2023)
- Coibion et al. (2017) vs Inui et al. (2020)
   → quality of survey data, no unconventional MP

Wage Inequality

Monetary Policy

Results and Sub-Channels 0000000

### Research Agenda

#### Research Question:

How does conventional and unconventional monetary policy affect the quarterly wage distribution and why?

#### Agenda:

- Create quarterly wage inequality measures with admin data (SIAB)
- Identify exogenous conventional and unconventional monetary policy shocks
- Estimate IRFs in a IV local projection framework
- Decompose of the Earnings Heterogeneity Channel

Wage Inequality

Monetary Policy

Results and Sub-Channels 0000000

## SIAB Data

- Stichprobe integrierter Arbeitsmarkt-Biographien (SIAB) by the IAB
- 2% random sample of German labour market participants
- 1975-2019  $\rightarrow$  1.9 million worker, 72 million observations

Wage Inequality

Monetary Policy

Results and Sub-Channels 0000000

# SIAB Data

- Stichprobe integrierter Arbeitsmarkt-Biographien (SIAB) by the IAB
- 2% random sample of German labour market participants
- 1975-2019  $\rightarrow$  1.9 million worker, 72 million observations

#### Strengths

- large (sub-)samples
- reliable
- gross wages
- representative

#### Weaknesses

- top-coded wages
- average wage btw reports

Monetary Policy

Results and Sub-Channels 0000000

# Temporal Disaggregation

- Combining known annual wage deciles and within-year sub-sample dynamics
- Litterman (1983): Estimate missing quarterly values of an annual series by quarterly indicator series
  - GLS Regression:  $Y_t = CX_q \beta + Cu$
  - Annual value of the *estimated* quarterly series is consistent with the annual series
- Suitable indicators: "employed changers" subsample
  - incumbents with reports during the year unrelated to monetary policy
  - average age, tenure, high education share close to overall sample Table

Wage Inequality

Results and Sub-Channels 0000000

#### Quarterly Wage Inequality

Wage Inequality

Monetary Policy

Results and Sub-Channels 0000000

# **IV Local Projections**

- Estimate IRFs according to Jordà (2005) using instrumental variables
- Cumulative relative change compared to pre-policy change

$$ln(y_{t+h}) - ln(y_{t-1}) = c^{h} + \sum_{p=1}^{P} \alpha_{p}^{h} ln(y_{t-p}) + \beta^{h} \widehat{policy_{t}^{i}} + \phi^{h} X_{t}^{i} + u_{t+h}^{h}, \quad h = 0, 1, ..., H$$

*y* real gross wage deciles or percentile ratios *policy* Policy Rate change or (3 quarter) Balance Sheet change

X current and lagged HICP, lagged instruments, other monetary policy tool

Monetary Policy

Results and Sub-Channels 0000000

## High-frequency Identification

- Exogenous monetary policy shocks: Shock series
  - Data and Euro area application by Altavilla et al. (2019)
  - Changes in OIS rates in a 3h window around ECB announcements
  - Anticipated effects incorporated, controlling for reverse causality, unpredictable
- Target rate, Forward guidance and QE shocks controlled for info effects
- Endogenous monetary tools instrumented by monetary policy shocks:
  - Policy Rate change Target Rate shock
  - Balance Sheet change QE shock and QE announcement (Dedola et al., 2021)

#### Channel Decomposition - Policy Rates

Monetary Policy

Results and Sub-Channels

# Channel Decomposition - QE

# Conclusion

- Exogenous monetary policy shocks and administrative labour market data
- Lower wages react (i) stronger and (ii) quicker to monetary policy changes
- Interest rate effects are similar across the wage distribution
- QE reduces wage inequality, by affecting mainly the bottom of the distribution
- Main channels: job creation and job switching

# Appendix

#### References

#### Literature Overview

#### Heterogeneous Agent Models:

• Gornemann et al. (2016), Dolado et al. (2021), Faia et al. (2023)

Empirical studies (on wage inequality):

- Survey data: Coibion et al. (2017), Furceri et al. (2018), Inui et al. (2020)
- Administrative data: Amberg et al. (2022), Broer et al. (2023), Andersen et al. (2021)
- Unconventional Monetary Policy: Lenza & Slacalek (2018)

Contributions:

- 1. Analysing quarterly dynamics with admin data (SIAB)
- 2. Comparison between conventional and unconventional monetary policy
- 3. Decomposition of the Earnings Heterogeneity Channel

### Data preparation

- 1. Transform spell data to quarterly panel
  - splitting the long spells
  - identifying the main spell per period, add other wages
  - defining the main observation per quarter
- 2. Deflate daily gross wages by German CPI
- 3. Sample selection: 20-60 years, non-marginal worker and subsamples: enter, leave, incumbents, employed changer
- 4. Wage percentiles and inequality measures (80-20, 80-50, 50-20 ratio)
- 5. Correction of structural breaks and outlier
- 6. Seasonal adjustment (X-13ARIMA-SEATS)

### Temporal Disaggregation - Regression

The annual-frequency GLS regression:

$$Y = CX\beta + Cu \tag{1}$$

$$C = \begin{bmatrix} 1/4 & 1/4 & 1/4 & 1/4 & 0 & 0 & 0 & 0 & \cdots & 0 \\ 0 & 0 & 0 & 1/4 & 1/4 & 1/4 & 1/4 & \cdots & 0 \\ \vdots & \ddots & \vdots \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & \cdots & 1/4 \end{bmatrix}$$

The linear unbiased estimate of quarterly  $Y_h$  is given by:

$$\hat{Y}_h = X\hat{\beta} + VC'(CVC')^{-1}[Y - CX\hat{\beta}]$$

# Sample Characteristics

	1975-1991	1992-1998	1999-2008	2009-2019	qtr corr	
Average Age						
Average Age	20.12	20.00	40.40	40.04	1.00	
All	38.13	39.08	40.40	42.04	1.00	
Changers	-4.42	-3.22	-3.39	-4.31	0.82	
Employed Changers	-0.32	-0.54	-0.80	-0.79	0.87	
Average Tenure						
All	1 641 69	2 312 43	2 672 18	2 068 48	1.00	
	1,041.09	2,512.45	2,072.10	2,500.40	1.00	
Changers	-949.54	-1,362.84	-1,438.79	-1,738.13	0.78	
Employed Changers	-28.99	-95.22	-59.65	-111.78	0.98	
Higher Education Share						
All	5.81	10.02	13.49	18.54	1.00	
Changers	0.05	-0.13	-0.29	-1.02	0.97	
Employed Changers	-1.06	-0.61	0.68	0.25	0.92	
(Average) Median Wag	le l					
All	83.14	89.29	90.35	89.07	1.00	
Changers	-13.49	-16.82	-17 70	-20.94	0.51	
Employed Changers	-13.49	-10.02	-17.70	-20.94	0.51	
Employed Changers	-3.51	-2.67	-1.08	-4.44	0.67	

Note: This table compares age, tenure, higher education share and median wage of the subsamples "Changers" and "Employed Changers" to the main sample (AlI). Tenure counts the days a worker is employed at a firm. The higher education share shows the sample share of workers with a university or Fachhochschul degree. Wages are the daily gross real wages. The average values are reported for the period 1975-1991 (pre Reunification in SIAB), 1992-1998 (pre Euro), 1999-2008 (pre GFC) and 2009-2019. The last column shows the quarterly correlation with "AlI" over the whole period. Source: factually anonymized SIAB 2019 

### National Accounts Comparison

## Indicator Comparison

#### Interpolated Wage Deciles

# High-frequency Identification - Details

- Exogenous monetary policy shocks by high-frequency approach
  - Isolate the impact of news about monetary policy in a tight window 

     MP timeline
  - Unanticipated part of the policy action
  - Euro Area Monetary Policy Event-Study Database (Altavilla et al., 2019)
- PCA to extract 3 relevant factors from different maturities
- Orthogonal rotation for interpretation: Target rate, Forward guidance and QE
- Remove information effects (Jarocinski and Karadi, 2020)
- Weighted average of two monetary policy meetings/shocks (instead of eight)
