Introduction				

Motivation

- Shift out of the Beveridge curve after the economic recovery of the subprime crisis.
- Skill mismatches \rightarrow Continuing Vocationnal Training (CVT) for job seekers.
- In 2020, individuals without any diploma faced an unemployment rate of 13.9% compared to 8% for all individuals.
- PIC: 15 billion euros between 2018 and 2023.

What does the literature say?

- A large literature on the effects of CVT on the return to regular employment and on earnings (Crépon et al., 2012; Card et al., 2018).
- Training program effectiveness varies based on individuals' characteristics: qualification level (Cavaco *et al.*, 2013), gender (Bergemann and Van den Berg, 2008), or age (Bonnal *et al.*, 1997).

Introduction				

Research Question

Do more innovative training programmes for job seekers improve return to regular employment and working conditions?

Method

- Estimation of the average effect of IC training on trainees using multiple regression methods (OLS and probit models).
- Analyze of the heterogeneity of the effect for subgroups of job seekers.
- Robustness check considering matching estimators and placebo test.

Contributions

- Differentiate training programmes for job seekers based on the content of the training, its organization, and the teaching methods.
- Estimate the heterogeneity of the effect for different subgroups of job seekers.
- Provide targeting recommendations to make this policy more efficient.

Policy Context				

A. Who is in charge?

- French regional councils and *Pôle Emploi/ France Travail*: operational implementation.
- The government set up programmes with specific goals and targeting some populations:
 - PIC (2018-2023): 15 billion euros, mainly targets young people and low education levels.
 - Half of the PIC budget is transferred to regional councils.
 - Innovation in training programmes
- Only one selection criteria : being a job seeker.

000	○○○○●	000000	000000	00000
Policy Context				

B. The Experimentation

- Name of the experimentation : IC.
- Training programmes without cutoff : usually they have to do first a preparation training programme and then a qualifying training programme
- Personalization of the training programme through an assessment at the beginning of the training and a personal advisor all along the training programme.
- Modularization of training.
- Each individual should have a different schedule based on their skills
- Training programme (diploma) vs Training pathway (skills)

Introduction	Policy Context	Data and Method	Results	Conclusion
000	00000	○○○○○○	000000	00000
Data and Method				

A. Data

- A dataset including FORCE (DARES) and the Regional databases.
- 1,763 trainees, including 126 trained through the experiment IC.
- Only qualifying training in 2020 and 2021.
- Common training industry and French departments of residence between IC and job seekers who benefit from standard training.
- Observation of professional trajectories over 12 months after the end of training.
- Outcome variables: return to employment, earning income, and job contract duration.

Data and Me	ethod			

B. Method

• Estimate the average effect of the training on job seekers who actually benefited from it:

$$\mathsf{ATT} = \mathbb{E}\left(Y_{1i} - Y_{0i} \mid T_i = 1\right) \tag{1}$$

- As a control group, we only have information on job seekers who received standard training. ATT therefore measures the contribution of the IC scheme compared to standard training.
- Using OLS:

$$Y_i = \alpha + \beta T_i + \gamma X_i + \varepsilon_i \tag{2}$$

イロト イポト イヨト イヨト

where Y is the outcome variable, X is the set of control variables, T is the treatment, and β is the estimator of \widehat{ATT} .

- Estimation on subgroups by education level for heterogeneity.
- Robustness of results using matching methods and placebo test.

Robustness				

- Similar results with propensity score estimators (PSM with 5 or 10 nearest neighbors estimators).
- The PS is estimated using a probit or linear probability model and SD were estimated by bootstrap with 200 replications.
- Balancing tests : Rosenbaum and Rubin (1985).
- Placebo test : End of the simulated training the 1rst Janury 2017 (1,445 individuals with 98 IC, more than 75% of our initial sample)

Month	ATT (pvalue)
Month 2	0.009 (0.697)

000	00000	000000	000000	O●OOO
Conclusion				

Conclusion

- A rather negative medium-term effect of the experimental training compared to standard training on employment.
- A positive effect on employment and working conditions of the experimental training for job seekers without any diploma, but negative for individuals with high school diploma.
- Individualization or adding basic skills to a standard training programme?
- Impact on more qualified individuals being directed towards training designed for those facing difficulties
- Better targeting of participants in the experimental training could improve policy effectiveness.
- Limitation of sample size and actual pedagogical innovation implemented.
